-----Merge Analysis-----

Analyst: Kelly Tran  
 Agency/Co.: Stantec Consulting Services  
 Date performed: 06/19/17  
 Analysis time period: AM Peak Hour  
 Freeway/Dir of Travel: State Route 60 Eastbound  
 Junction: Archibald Ave EB On-Ramp  
 Jurisdiction: Caltrans District 8  
 Analysis Year: 2017  
 Description: WOCC Mainline Analysis - Existing 2017 Conditions

-----Freeway Data-----

Type of analysis	Merge		
Number of lanes in freeway	4		
Free-flow speed on freeway	70.0	mph	
Volume on freeway	5726	vph	

-----On Ramp Data-----

Side of freeway	Right		
Number of lanes in ramp	1		
Free-flow speed on ramp	35.0	mph	
Volume on ramp	414	vph	
Length of first accel/decel lane	640	ft	
Length of second accel/decel lane		ft	

-----Adjacent Ramp Data (if one exists)-----

Does adjacent ramp exist?	No

 Analysis Year: Horizon Year 2040  
 Description: WOCC Mainline Analysis

-----Freeway Data-----

Type of analysis	Diverge		
Number of lanes in freeway	3		
Free-flow speed on freeway	70.0	mph	
Volume on freeway	6878	vph	

-----Off Ramp Data-----

Side of freeway	Right		
Number of lanes in ramp	1		
Free-Flow speed on ramp	35.0	mph	
Volume on ramp	2198	vph	
Length of first accel/decel lane	405	ft	
Length of second accel/decel lane		ft	

-----Adjacent Ramp Data (if one exists)-----

Does adjacent ramp exist?	No		
Volume on adjacent ramp		vph	
Position of adjacent ramp			
Type of adjacent ramp			
Distance to adjacent ramp		ft	

-----Conversion to pc/h Under Base Conditions-----

Junction Components	Freeway	Ramp	Adjacent Ramp	
Volume, V (vph)	6878	2198		vph
Peak-hour factor, PHF	0.94	0.94		
Peak 15-min volume, v15	1829	585		v
Trucks and buses	0	0		%
Recreational vehicles	0	0		%
Terrain type:	Level	Level		
Grade	0.00 %	0.00 %		%
Length	0.00 mi	0.00 mi		mi
Trucks and buses PCE, ET	1.5	1.5		
Recreational vehicle PCE, ER	1.2	1.2		

Heavy vehicle adjustment, fHV	1.000	1.000	
Driver population factor, fP	1.00	1.00	
Flow rate, vp	7317	2338	pcph

----- Estimation of V12 Diverge Areas -----

L = (Equation 13-12 or 13-13)

EQ

P = 0.470 Using Equation 5

FD

$v_{12} = v_R + (v_F - v_R) P = 4676$  pc/h

----- Capacity Checks -----

	Actual	Maximum	LOS F?
$v_{12} = v_{12}$	7317	7200	Yes
$v_{FO} = v_F - v_R$	4979	7200	No
$v_R$	2338	2000	Yes
$v_3$ or $v_{av34}$	2641 pc/h	(Equation 13-14 or 13-17)	
Is $v_3$ or $v_{av34} > 2700$ pc/h?		No	
Is $v_3$ or $v_{av34} > 1.5 v_{12} / 2$		No	
If yes, $v_{12A} = 4676$		(Equation 13-15, 13-16, 13-18, or 13-19)	

----- Flow Entering Diverge Influence Area -----

	Actual	Max Desirable	Violation?
$v_{12}$	4676	4400	Yes

----- Level of Service Determination (if not F) -----

Density,  $D = 4.252 + 0.0086 v_R - 0.009 L_D = 40.8$  pc/mi/ln

Level of service for ramp-freeway junction areas of influence F

----- Speed Estimation -----

Intermediate speed variable,	D = 0.638	
Space mean speed in ramp influence area,	S <sub>R</sub> = 52.1	mph
Space mean speed in outer lanes,	S <sub>0</sub> = 70.4	mph
Space mean speed for all vehicles,	S = 57.5	mph

**SECTION 1.0** INTRODUCTION AND EXECUTIVE SUMMARY

The purpose of this traffic impact analysis (TIA) is to identify intersection and roadway infrastructure requirements and to evaluate traffic conditions associated with the proposed West Ontario Commerce Center (WOCC) Specific Plan development. The results of this analysis have been used to identify roadway and intersection infrastructure improvements, including off-site mitigations, which accommodate traffic generated by West Ontario Commerce Center and surrounding developments in accordance with City of Ontario circulation network minimum level of service LOS D criteria for roadway segments and LOS E for intersections.

Forty-eight (48) signalized/unsignalized intersections are included in this analysis together with surrounding roadway segments. The Project study area is identified and discussed in more detail in Section II of this report.

Roadway link LOS was determined based on volume-to-capacity (v/c) analysis using City of Ontario General Plan roadway capacities. Intersection LOS was determined using the 2010 Highway Capacity Manual (HCM) signalized/unsignalized operational methods using City and San Bernardino County Transportation Authority (SBCTA) CMP traffic analysis guidelines.

The West Ontario Commerce Center project location and vicinity is shown on Figure 1-1. The proposed 119-acre Specific Plan project will provide up to 2,350,005 square feet of warehouse use and 555,5050 square feet for business park use. A preliminary Project site plan is shown on Figure 1-2. The proposed Specific Plan is forecast to generate up to 16,830 passenger car equivalent (PCE) vehicle trips per day which is 31.5% less than what could be allowed under the current General Plan.

The project is anticipated to be completed in 2023. This study analyzes the project opening year of 2023 and a build-out horizon year of 2040 in addition to existing 2017 conditions. The scenarios analyzed in this study include the following:

March 2018

---

- Existing (2017)
- Existing (2017) with Project
- Opening Year Cumulative (2023) No Project
- Opening Year Cumulative (2023) With Project
- Horizon Year (2040) No Project
- Horizon Year (2040) With Project

Traffic generation was based on rates/equations identified in the 9<sup>th</sup> Edition of the Institute of Transportation Engineers (ITE) *Trip Generation* which was the latest edition available at time of preparation of this study. Because the site is not a mixed-use or retail site, no internal trip capture or pass-by traffic is considered for this study.

Project trip generation volumes were reviewed and approved by the City of Ontario prior to assigning these trips to the study area roadway network for analysis. The project external trip distribution used for Project 2023 and 2040 build-out year analysis were derived from San Bernardino Association of Governments (SANBAG) SBTAM select zone model runs.

Following assignment to the study area network per the SBTAM trip distribution, project traffic volumes were combined with existing traffic volumes and cumulative traffic volumes from other identified development projects for the 2023 Project Opening Year analysis scenarios. Traffic volumes for this study were conducted in March of 2017. Traffic volumes for other development projects were generally taken directly from the approved traffic studies for those projects. In the few cases (4) where traffic studies were not available, traffic volumes for cumulative projects were based on applying ITE trip generation rates to proposed land use quantities. Future Year 2040 build-out scenario traffic volumes were derived from and calibrated to SBTAM model output.

Total study network traffic volumes were analyzed for the Project opening year (2023) to identify short-term cumulative project impacts and mitigations, as necessary. Analysis of Year 2040 build-out with Project conditions was conducted to confirm Master-Planned

March 2018

---

roadway and intersection infrastructure improvements provide target level of service (LOS) and to identify the Project's fair share contribution to mitigate future cumulative project impacts as necessary.

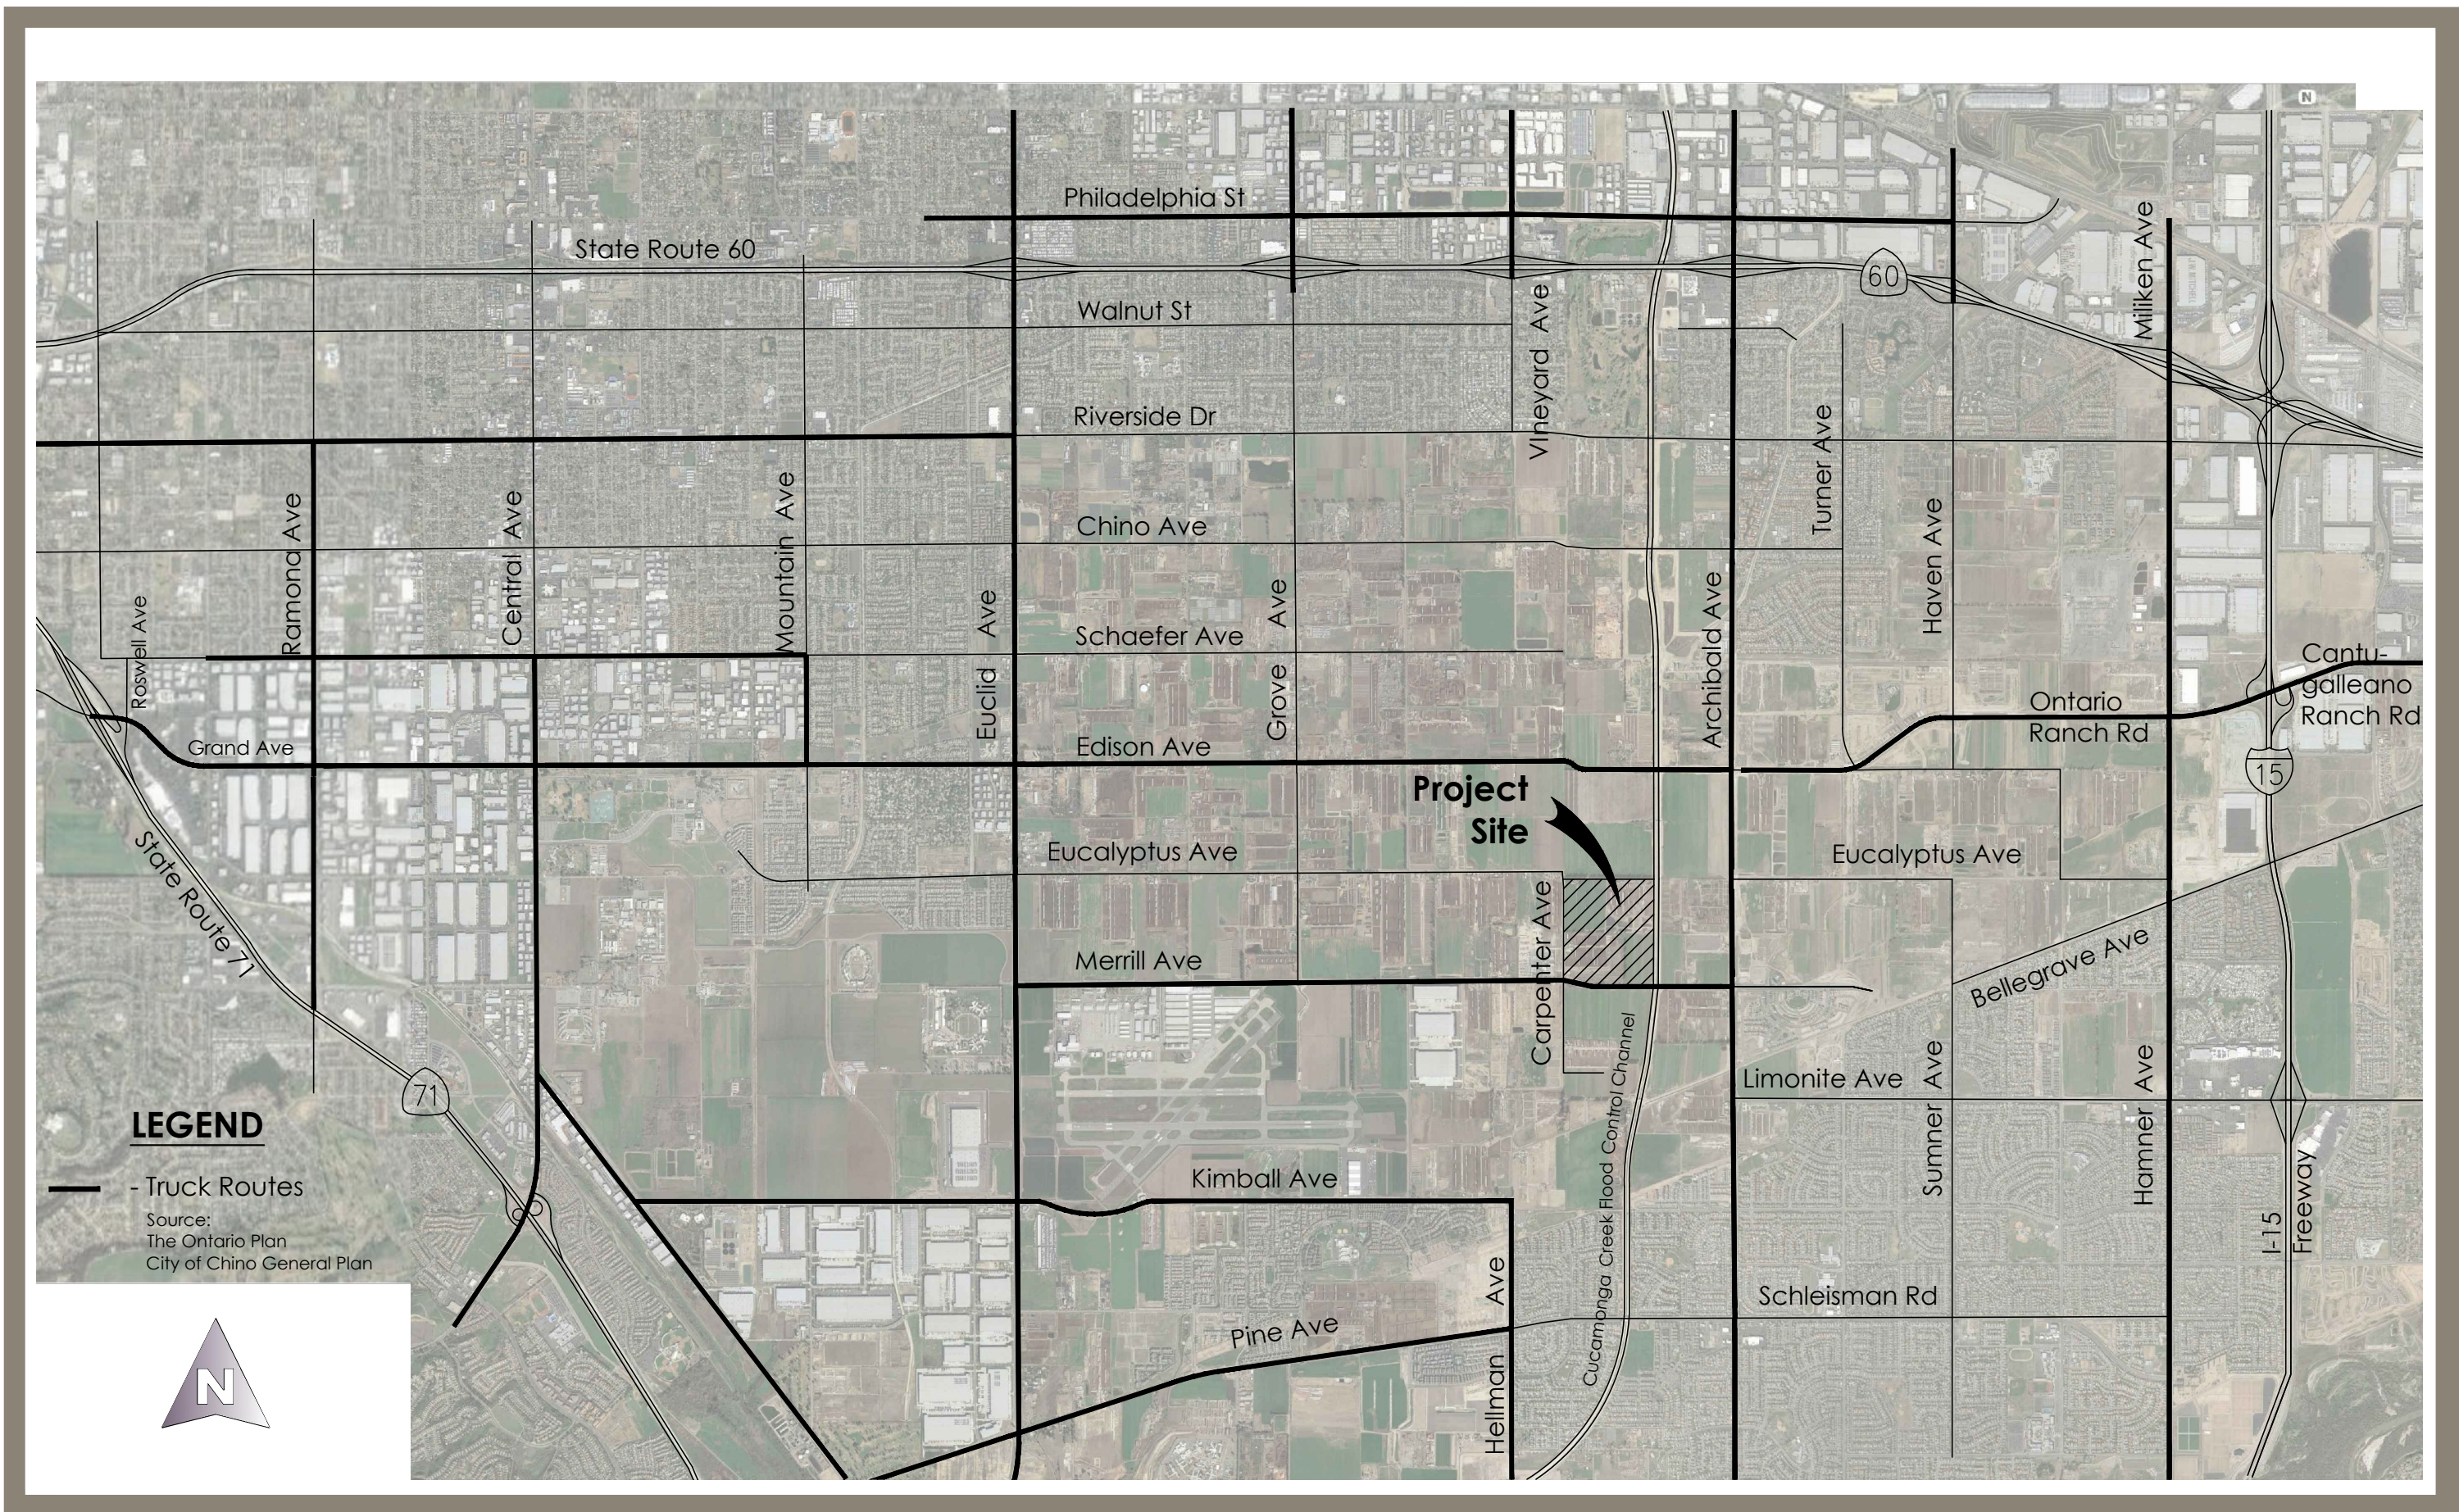

Each project year analysis scenario includes roadway and intersection infrastructure improvements planned for completion by their respective analysis year through established Developer Impact Fee (DIF) funding programs. No separate City capital improvement project (CIP) improvements have been identified within the study area for either scenario. Required intersection mitigation improvements beyond those included in Master-Planned DIF funding programs, have been identified on a Project "fair share" basis.

This study identifies a Project fair share contribution for mitigation measures at seventeen (17) off-site intersections to meet City of Ontario, Chino, Eastvale, and Caltrans LOS criteria. These intersections have been identified to have significant Project impact considering existing with Project, future opening year (2023) cumulative project, and 2040 build-out with West Ontario Commerce Center project volumes. Table 1-1 identifies these intersections together with specific mitigation improvements, agency jurisdiction, rough cost estimates, and fair share percentage and cost. Table 1-2 provides calculation of fair share contribution for each intersection. Fair share percentage was calculated by dividing the project generated traffic by total new traffic that will be generated by 2040 which includes project traffic and cumulative projects traffic.

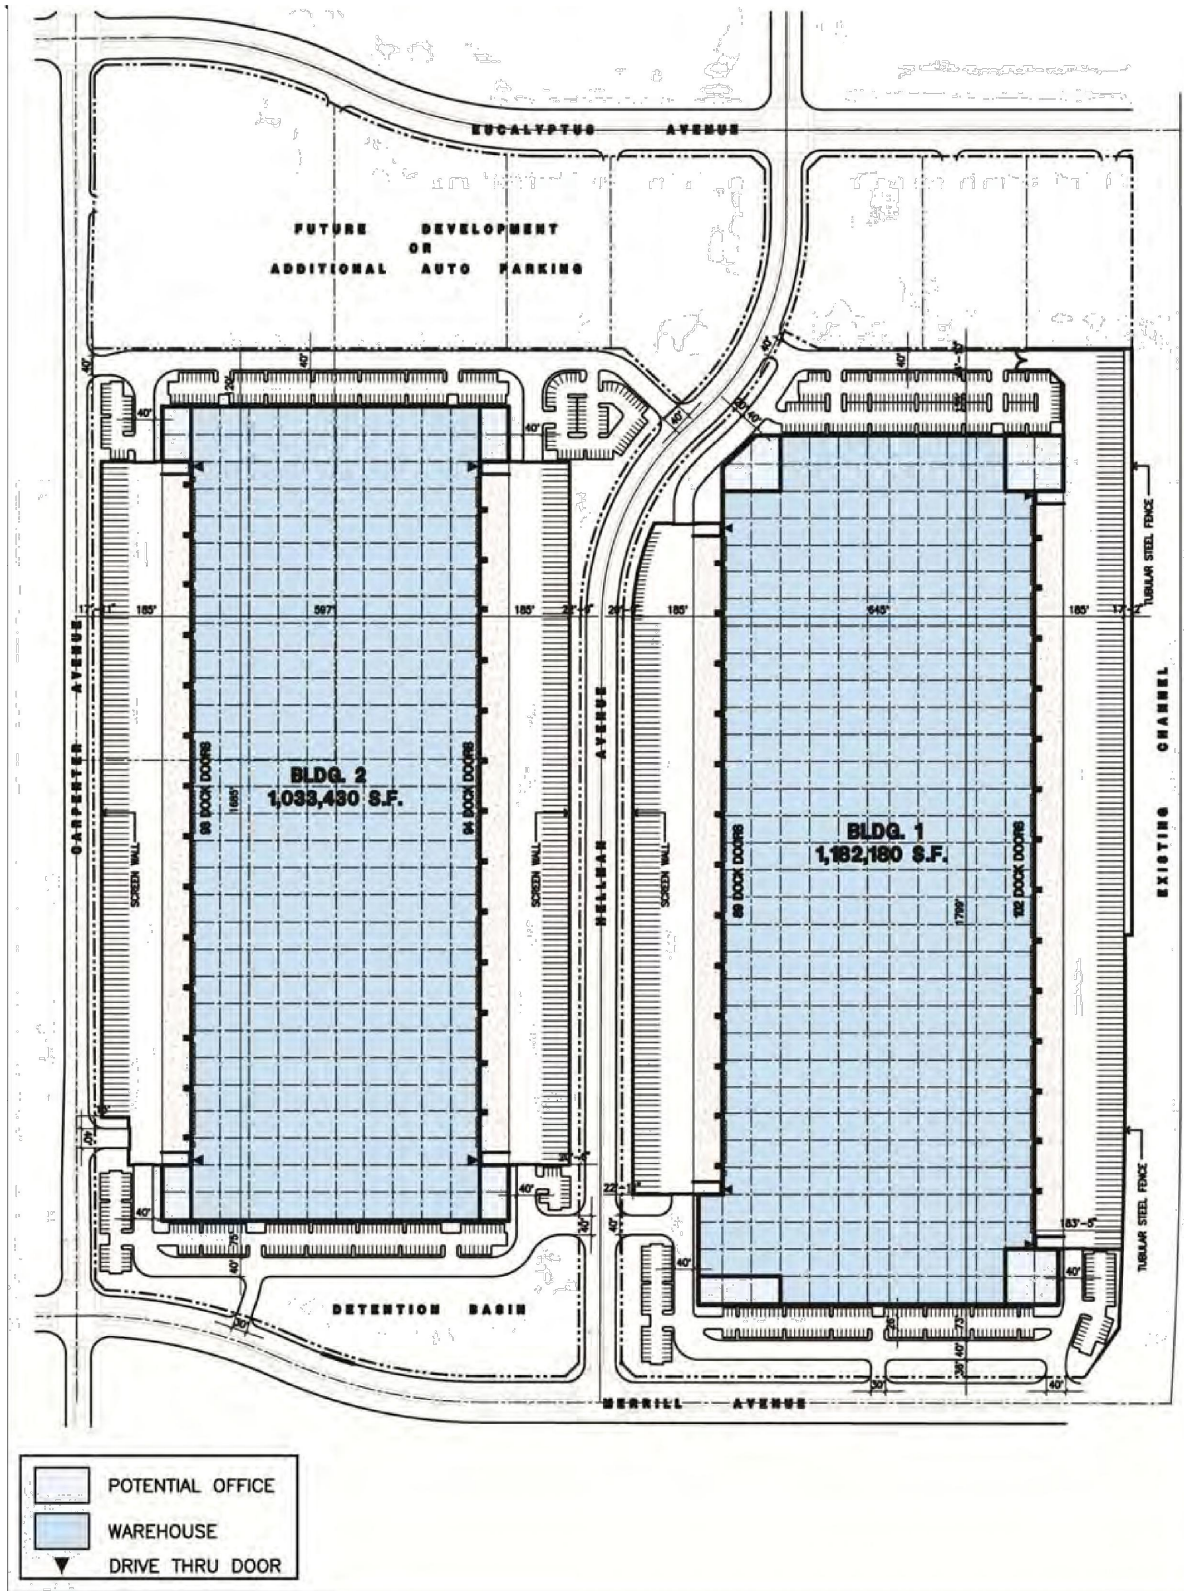

The total estimated cost of identified study area intersection improvements is \$20,315,520. Based on the Project fair share percentages shown on Table 1-2, the Project's fair share cost is estimated at \$1,624,723. The estimates in Table 1-1 are rough order of magnitude and are provided for discussion purposes only. They do not impart any legal responsibility or formula for contributions or mitigation, and are not intended to be binding.

This study confirms that the proposed Project Specific Plan infrastructure improvements will provide acceptable LOS along the roadways and intersections providing access to the site and are appropriately sized for forecast Project volumes.

**SECTION 2.0** EXISTING STUDY AREA CONDITIONS

---

## 2.1 PROJECT STUDY AREA

The project study area and intersections are shown on Figure 2-1A together with the number of through lanes on roadways. Existing intersection geometrics and controls are shown on Figures 2-1B and 2-1C. The Project site and most adjacent areas are currently undeveloped and have formerly been used for agricultural and dairy uses. A half mile to the southeast of the site there is residential development and a warehouse development to the southwest. Two miles southwest of the site is the Chino Airport and air museums.

Existing roadways in vicinity of the project include Merrill Avenue, Carpenter Avenue, Eucalyptus Avenue, Grove Avenue, and Archibald Avenue. State Route 60 is located approximately 2.5 miles north of the site and Interstate 15 is located approximately 2.5 miles east.

Figure 2-1A shows the following forty-eight (48) off-site intersections included in this study for analysis:

### Signalized Intersections

- 47. Hellman Avenue and Merrill Avenue

#### 2.1.1. Existing Traffic Volumes

Figure 2-2A provides existing am and pm peak hour two-way roadway link volumes on study area roadway segments. Figures 2-2B through 2-2E show existing weekday am and pm peak hour intersection turning movement volumes at study area intersections. Figure 2-3 shows existing weekday 24-hour volumes on roadway segments and volume-to-capacity (v/c) ratios. Traffic Data was collected in March 2017 for this study by National Data Collection and Surveying Services (NDS) and is included in the appendix. Schools were in session when this data was collected.

#### 2.1.2. Opening Year 2023 No Project Volumes

For this study, the Project has been analyzed for completion in year 2023. Opening year traffic volumes have been developed by adding traffic from identified future cumulative development projects. Twenty-five (25) cumulative development projects in addition to West Ontario Commerce Center were identified by the City of Ontario for this study and are shown on Figure 2-4. Figure 2-4 identifies the analysis scenario year in this study by which each cumulative project is anticipated to have been implemented and in which its traffic was added to existing traffic volumes.

March 2018

---

These projects include the Watson Industrial Park which is located diagonally adjacent to the project site on the southwest. At completion, this project will develop 3.872 million square feet of light industrial use. The Watson Industrial Park is a phased project scheduled for completion by 2019. The volumes assigned to each affected study area intersection are as identified in the Watson Industrial Park FEIR, dated November 18, 2015.

Figure 2-5A provides Opening Year 2023 No Project am and pm peak hour two-way roadway link volumes on study area roadway segments. Figures 2-5B through 2-5E show Opening Year 2023 No Project weekday am and pm peak hour intersection turning movement volumes at study area intersections. Figure 2-6 shows Opening Year 2023 No Project weekday 24-hour volumes on roadway segments and volume-to-capacity (v/c) ratios.

### 2.1.3. Horizon Year 2040 No Project Volumes

Figure 2-7A provides Horizon Year 2040 No Project am and pm peak hour two-way roadway link volumes on study area roadway segments. Figures 2-7B through 2-7E show Horizon 2040 Year No Project weekday am and pm peak hour intersection turning movement volumes at study area intersections. Figure 2-8 shows Horizon Year 2040 No Project weekday 24-hour volumes on roadway segments and volume-to-capacity (v/c) ratios.

### 2.1.4. Existing and Opening Year 2023 Level of Service (LOS) Analysis

To provide a detailed analysis of existing peak hour and Project year 2023 traffic conditions within the study area, the 2010 Highway Capacity Manual (HCM) Signalized Method was used to analyze existing signalized study area intersections. Using this method, the average control delay in seconds per vehicle is calculated for each intersection considering unique features including turning movement volumes, traffic signal phasing and timing, and the number and types of lanes on each approach.

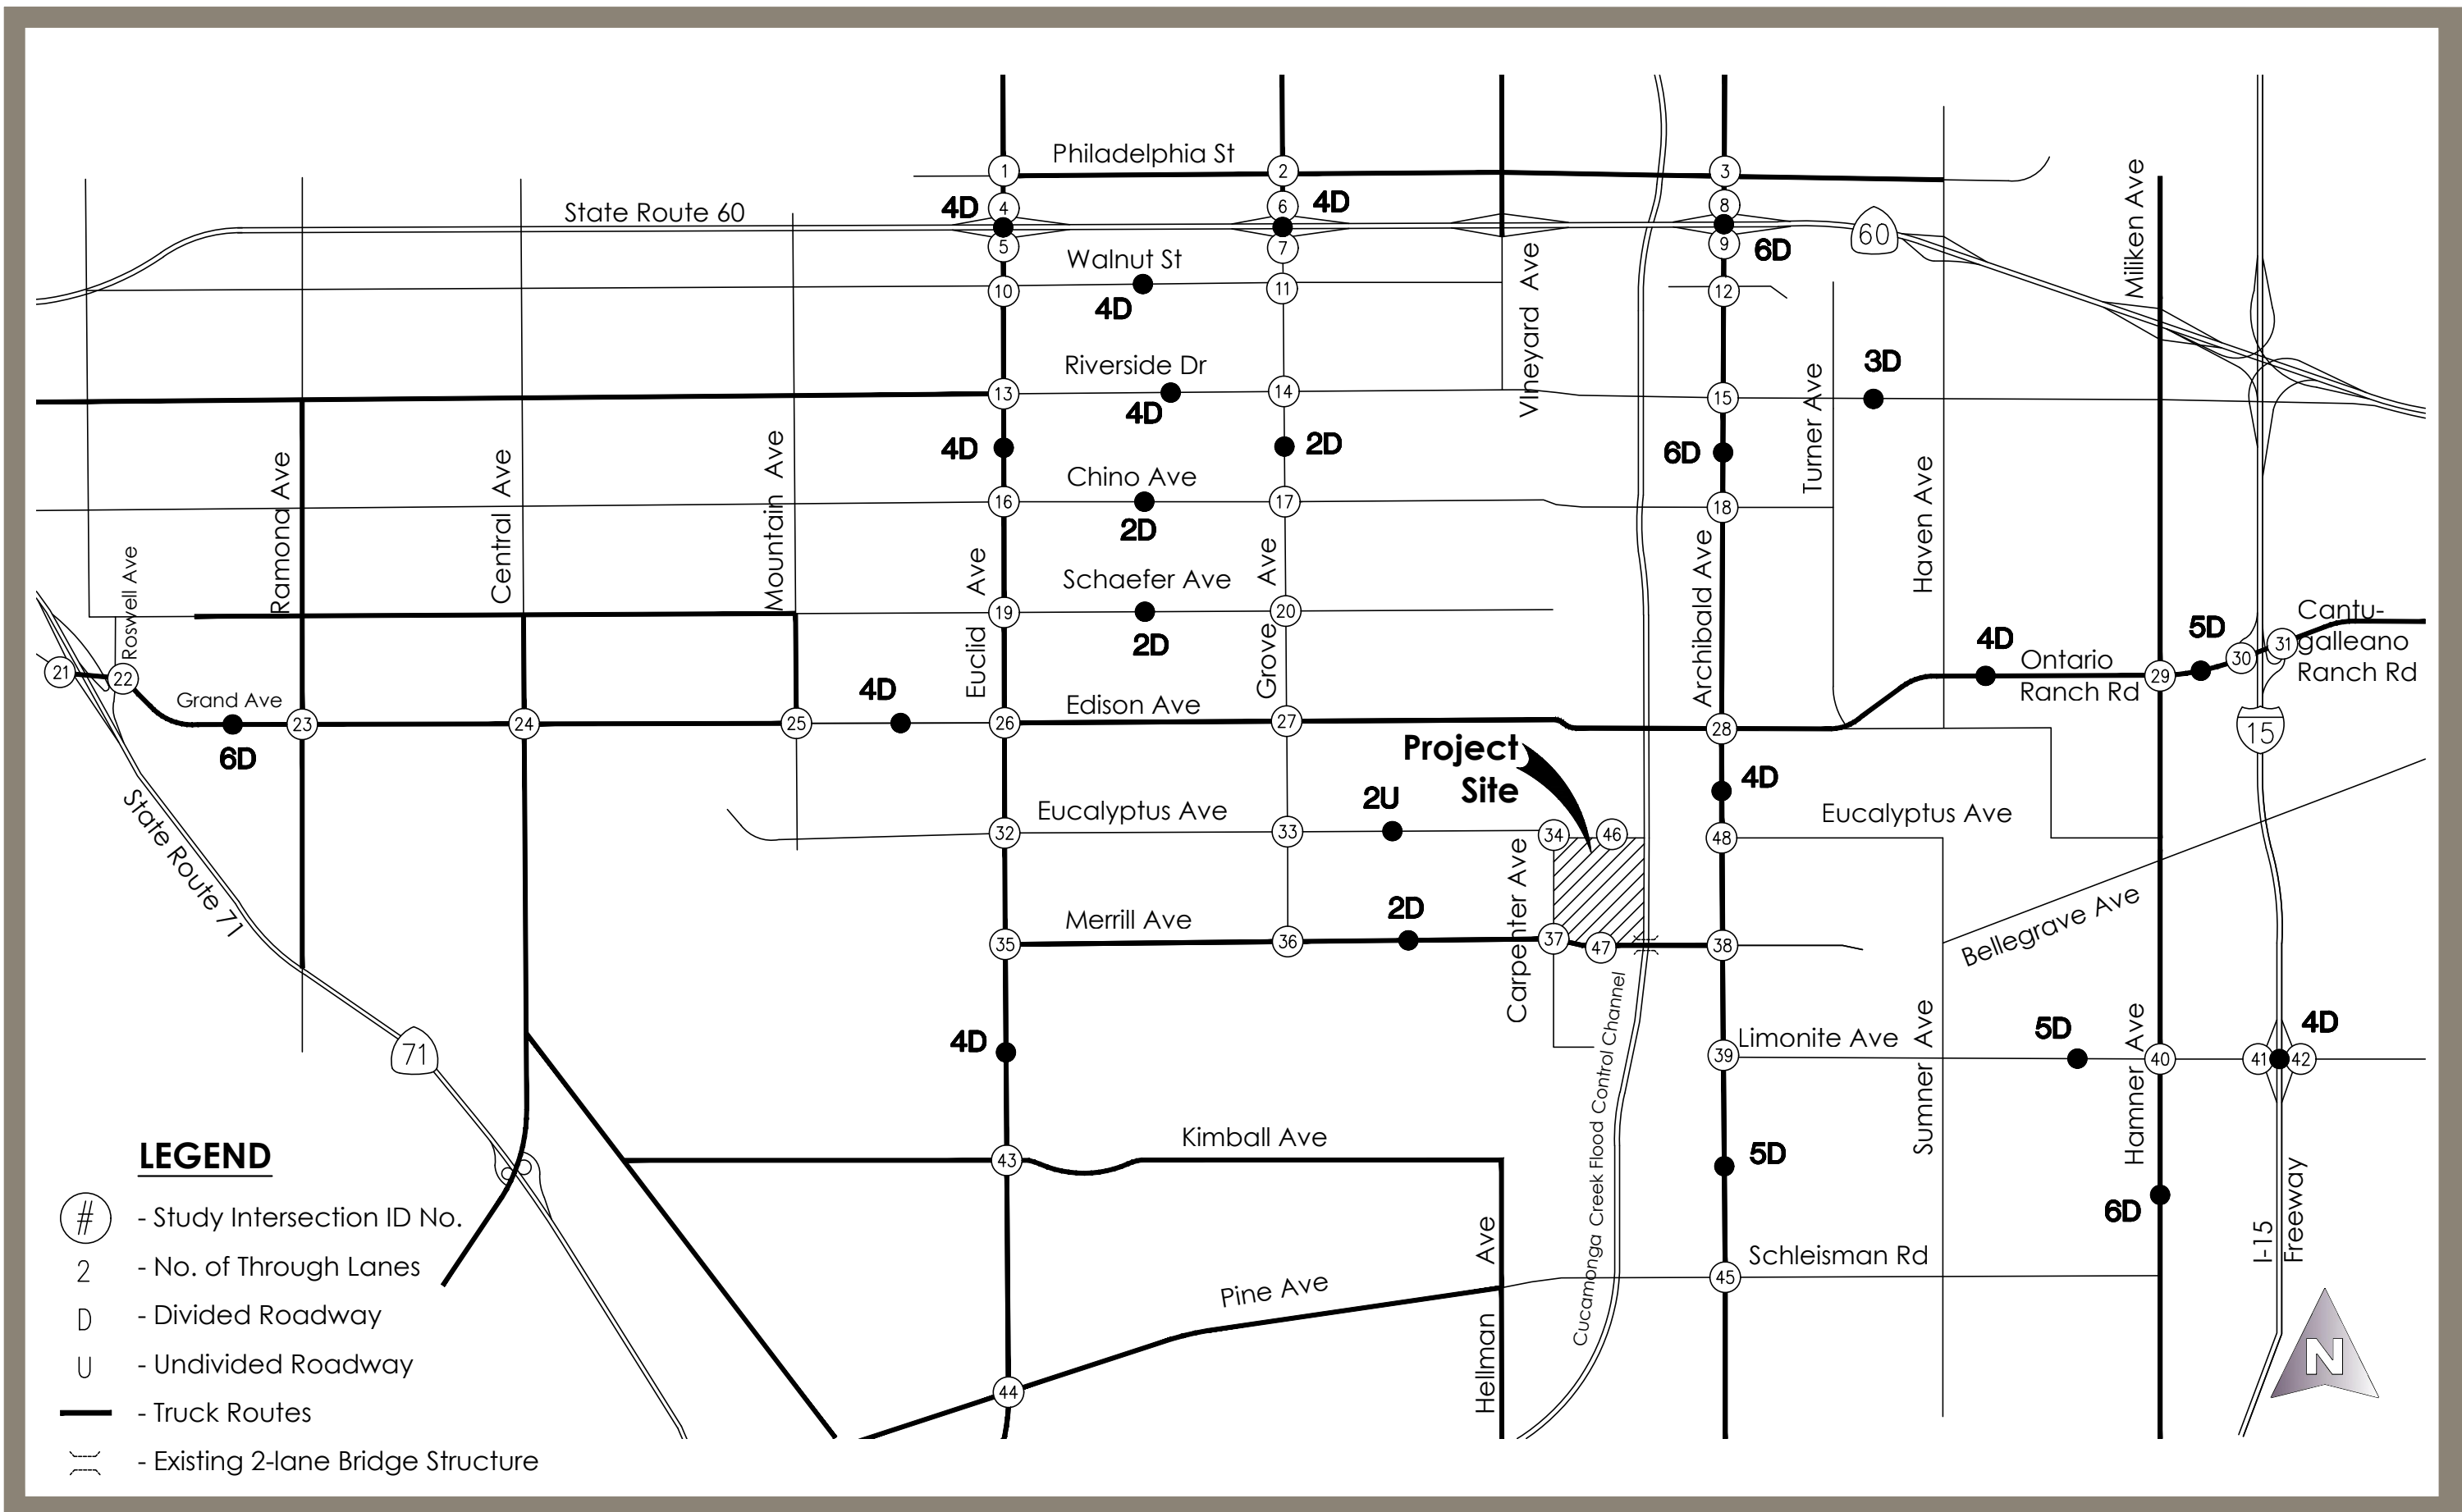

*March 2018*

---

The average control delay per vehicle is used to determine level of service at signalized intersections as shown on Table 2-1A.

Using the 2010 HCM operations method for unsignalized intersections, level of service is based on worst case approach delay as shown on Table 2-1B.

Table 2-2 shows the results of intersection level of service analysis for the study area intersections, separated by signalized/unsignalized control, under existing 2017 conditions and Table 2-3 for Opening Year 2023 conditions.

**Table 2-1A  
 Highway Capacity Manual (HCM) Analysis  
 Level of Service Descriptions  
 for Signalized Intersections**

Level of Service	Traffic Flow Description	Average Approach Delay Per Vehicle (SEC)
A	Operations with delay less than or equal to 5.0 sec per vehicle; signal progression extremely favorable and/or short cycle lengths; most vehicles do not stop	≤10.0
B	Operations with delay in the range of 5.1 to 15.0 sec per vehicle; good progression and/or short cycle lengths; higher levels of average delay; more vehicle stops than LOS A	10.01 to 20.00
C	Operations with delay in the range of 15.1 to 25.0 sec per vehicle; significant levels of delay	20.01 to 35.00
D	Operations with delay in the range of 25.1 to 40.0 sec per vehicle; noticeable congestion; unfavorable progression; long cycle lengths, or high v/c ratios; many vehicles stop and portion of vehicles not stopping declines; noticeable individual cycle failures	35.01 to 55.00
E	Operations with delay in the range of 40.1 to 60.0 sec per vehicle; limit of acceptable delay; poor progression; long cycle lengths and high v/c ratios; frequent occurrences of individual cycle failures	55.01 to 80.00
F	Operations with delay in excess of 60.0 sec per vehicle; considered unacceptable driver delay; congestion; oversaturation; poor progression; long cycle lengths; high v/c ratios over 1.00; many individual cycle failures	> 80.01

**Table 2-1B  
 Highway Capacity Manual (HCM) Analysis  
 Level of Service Descriptions  
 for Unsignalized Intersections**

Level of Service	Traffic Flow Description	Average Approach Delay Per Vehicle (SEC)
A	Operations with delay less than or equal to 10.0 sec per vehicle; most vehicles have a very short stop	≤10.0
B	Operations with delay in the range of 10.1 to 15.0 sec per vehicle; higher levels of delay, longer stops than LOS A	10.1 to 15.0
C	Operations with delay in the range of 15.1 to 25.0 sec per vehicle; significant levels of delay	15.1 to 25.0
D	Operations with delay in the range of 25.1 to 35.0 sec per vehicle; noticeable congestion; increased queue lengths; long delays	25.1 to 35.0
E	Operations with delay in the range of 35.1 to 50.0 sec per vehicle; limit of acceptable delay; very long delay; long queue lengths	35.1 to 50.0
F	Operations with delay in excess of 50.0 sec per vehicle; considered unacceptable driver delay; congestion; oversaturation; unacceptable queuing	> 50.0

### 2.1.5. Existing 2017 Traffic Conditions

Table 2-2 shows that all existing study area intersections except one are operating at acceptable level of service (LOS) E or higher during am and pm peak hours with existing 2017 traffic volumes and improvements. All unsignalized study area intersections are currently operating at Level of Service C or better during peak hours. Only the Grand Avenue signalized intersection at the SR-71 NB off-ramp (Int. No. 22) is predicted to operate at LOS F during the pm peak hour under existing conditions.

Figure 2-3 shows that study area roadway segments have volume-to-capacity (v/c) ratios below 0.90 and indicating LOS D or better operation based on existing 24-hour volumes and improvements.

### 2.1.6. Opening Year 2023 – No Project Traffic Conditions

Analysis of Opening Year 2023 - No Project conditions includes traffic from the cumulative development projects to be completed by 2023 as shown on Figure 2-4 and implementation of the following twenty-two (22) associated roadway/intersection improvements within the study area as listed on Table 2-4 and shown on Figures 2-9A through 2-9C.

Table 2-3 shows that for forecast Opening Year 2023 No Project conditions, thirty-eight (38) intersections are predicted to operate at LOS E and above in both peak hours. Table 2-5 shows that ten (10) intersections are predicted to operate at LOS F in at least one peak hour.

All stop-controlled intersections identified above satisfy at least one traffic signal warrant under Opening Year 2023 (no Project) conditions, and therefore, signalization of these intersections is considered a feasible mitigation.

March 2018

---

Figure 2-6 shows that study area roadway segments will continue to typically have volume-to-capacity ratios of 0.90 or below indicating LOS D or better operation based on Opening Year 2023 No Project 24-hour volumes.

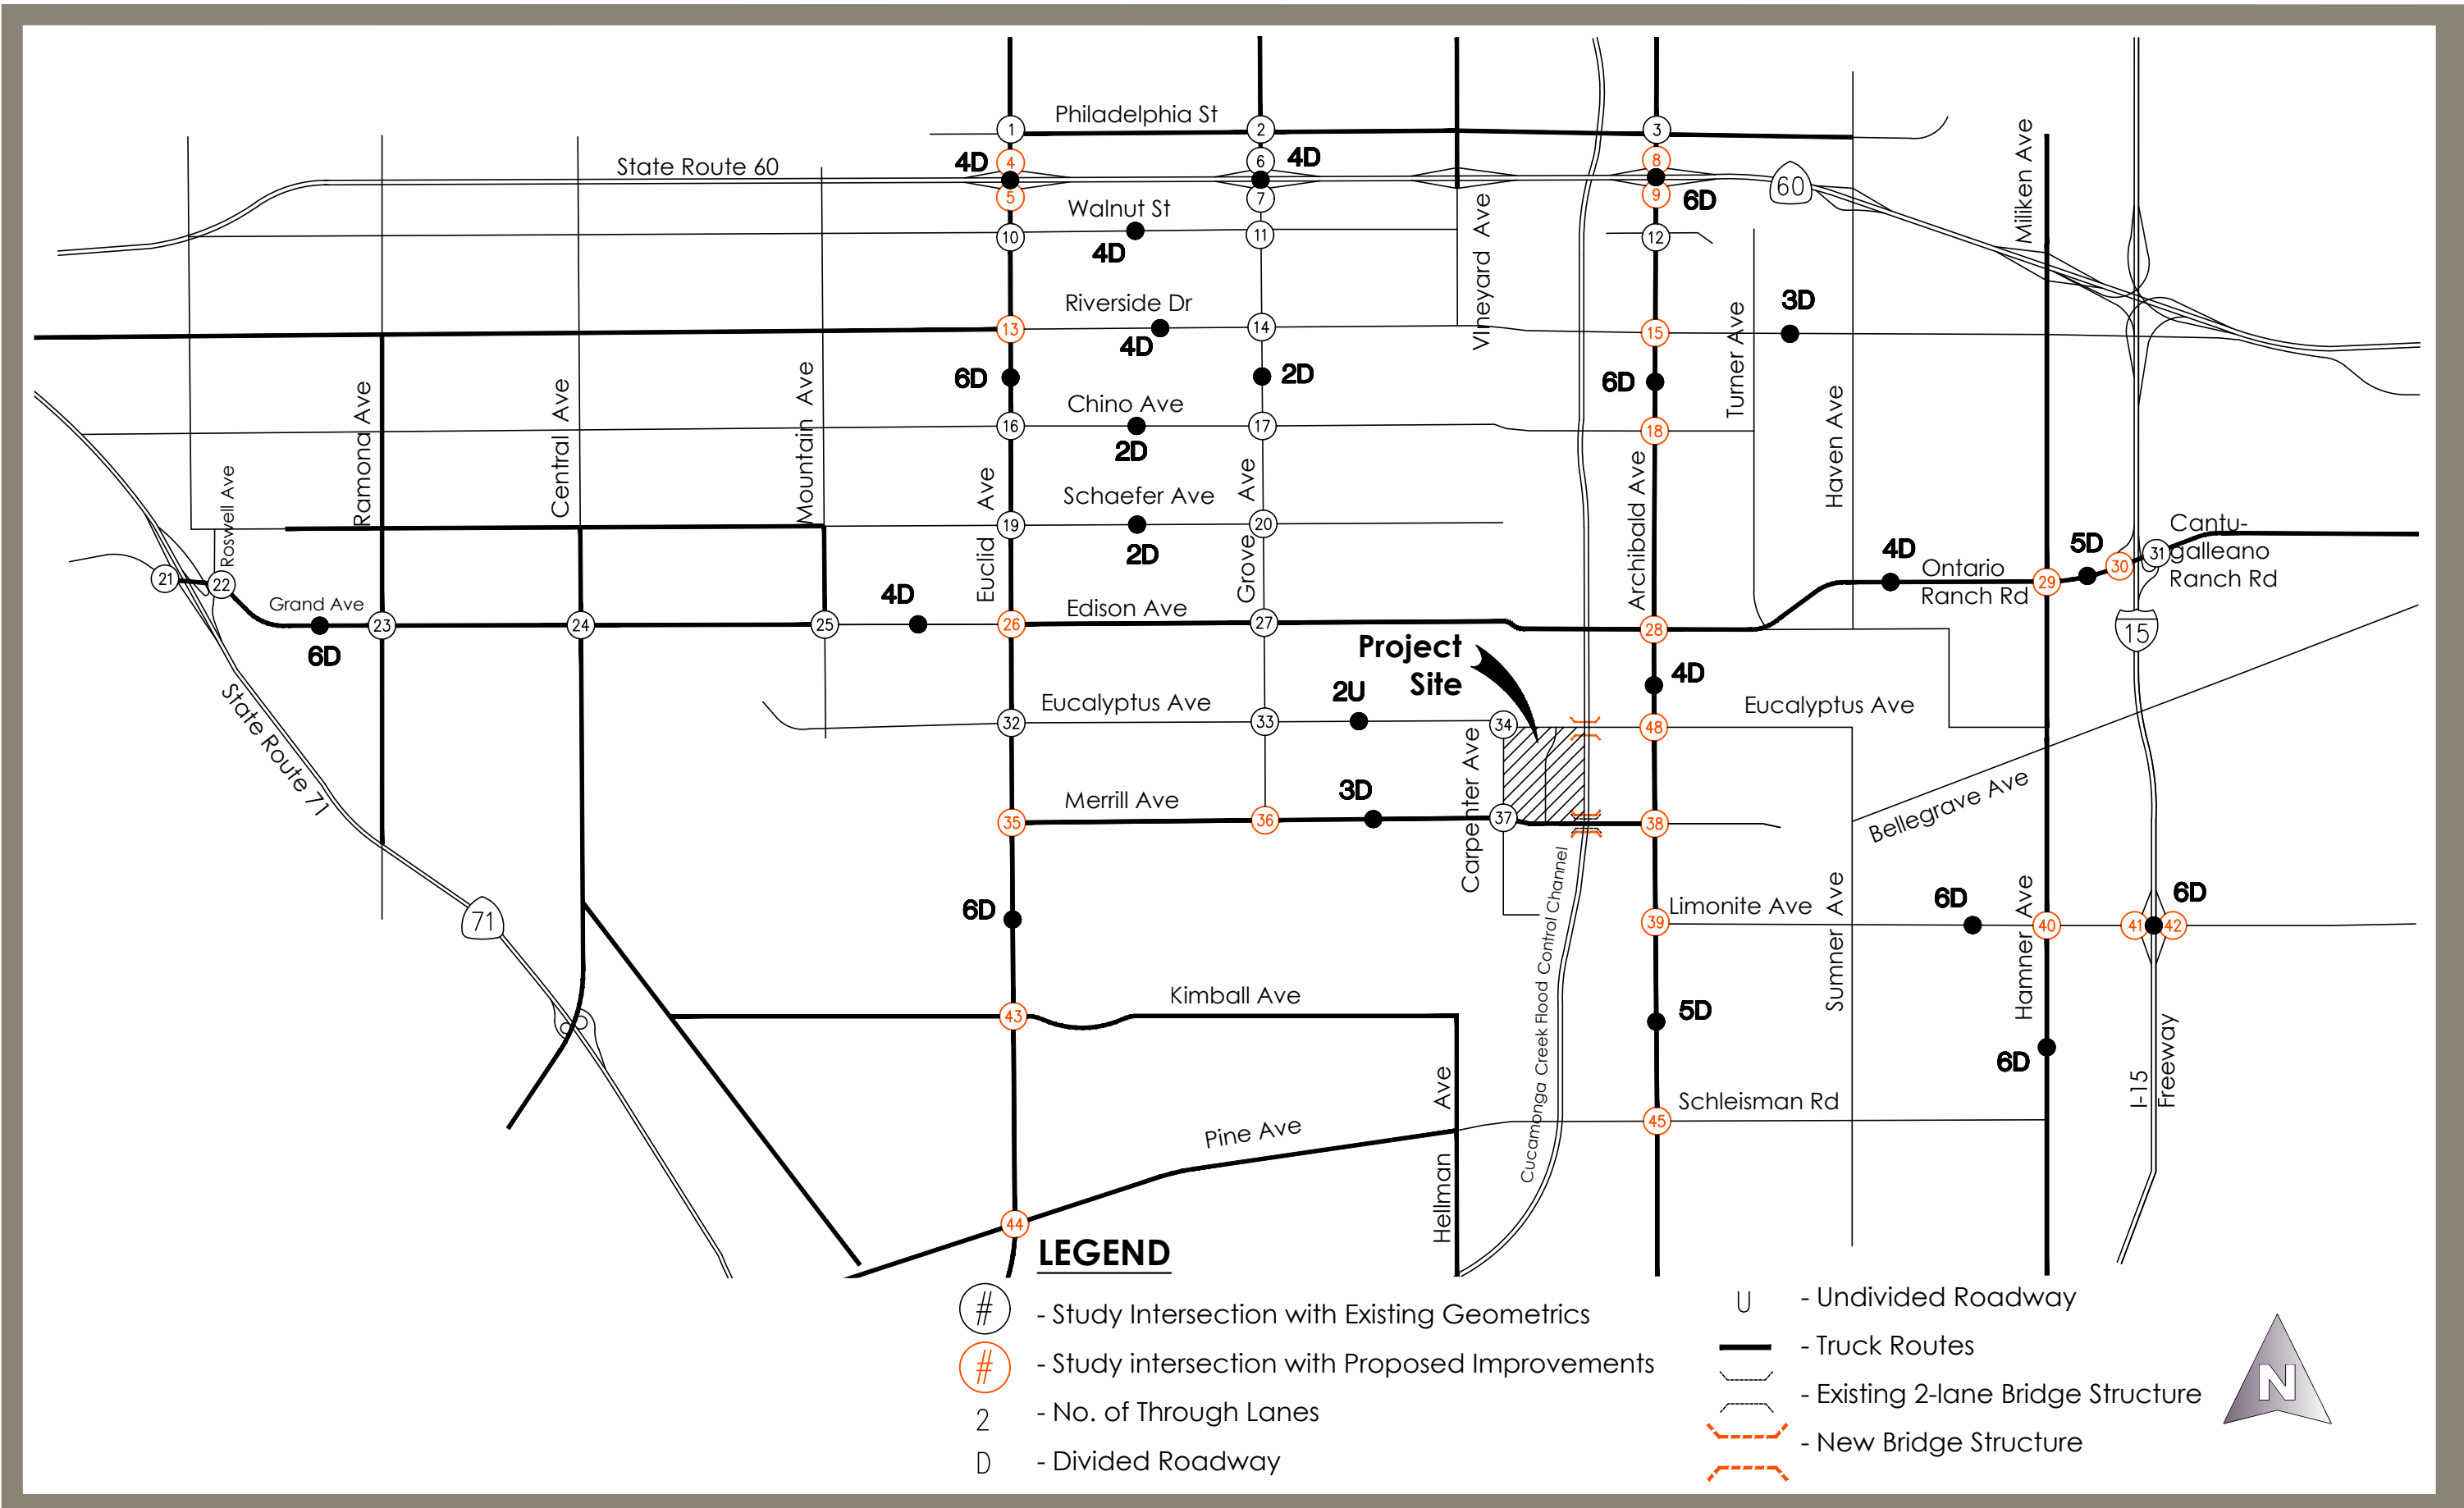

#### 2.1.7. Horizon Year 2040 – No Project Traffic Conditions

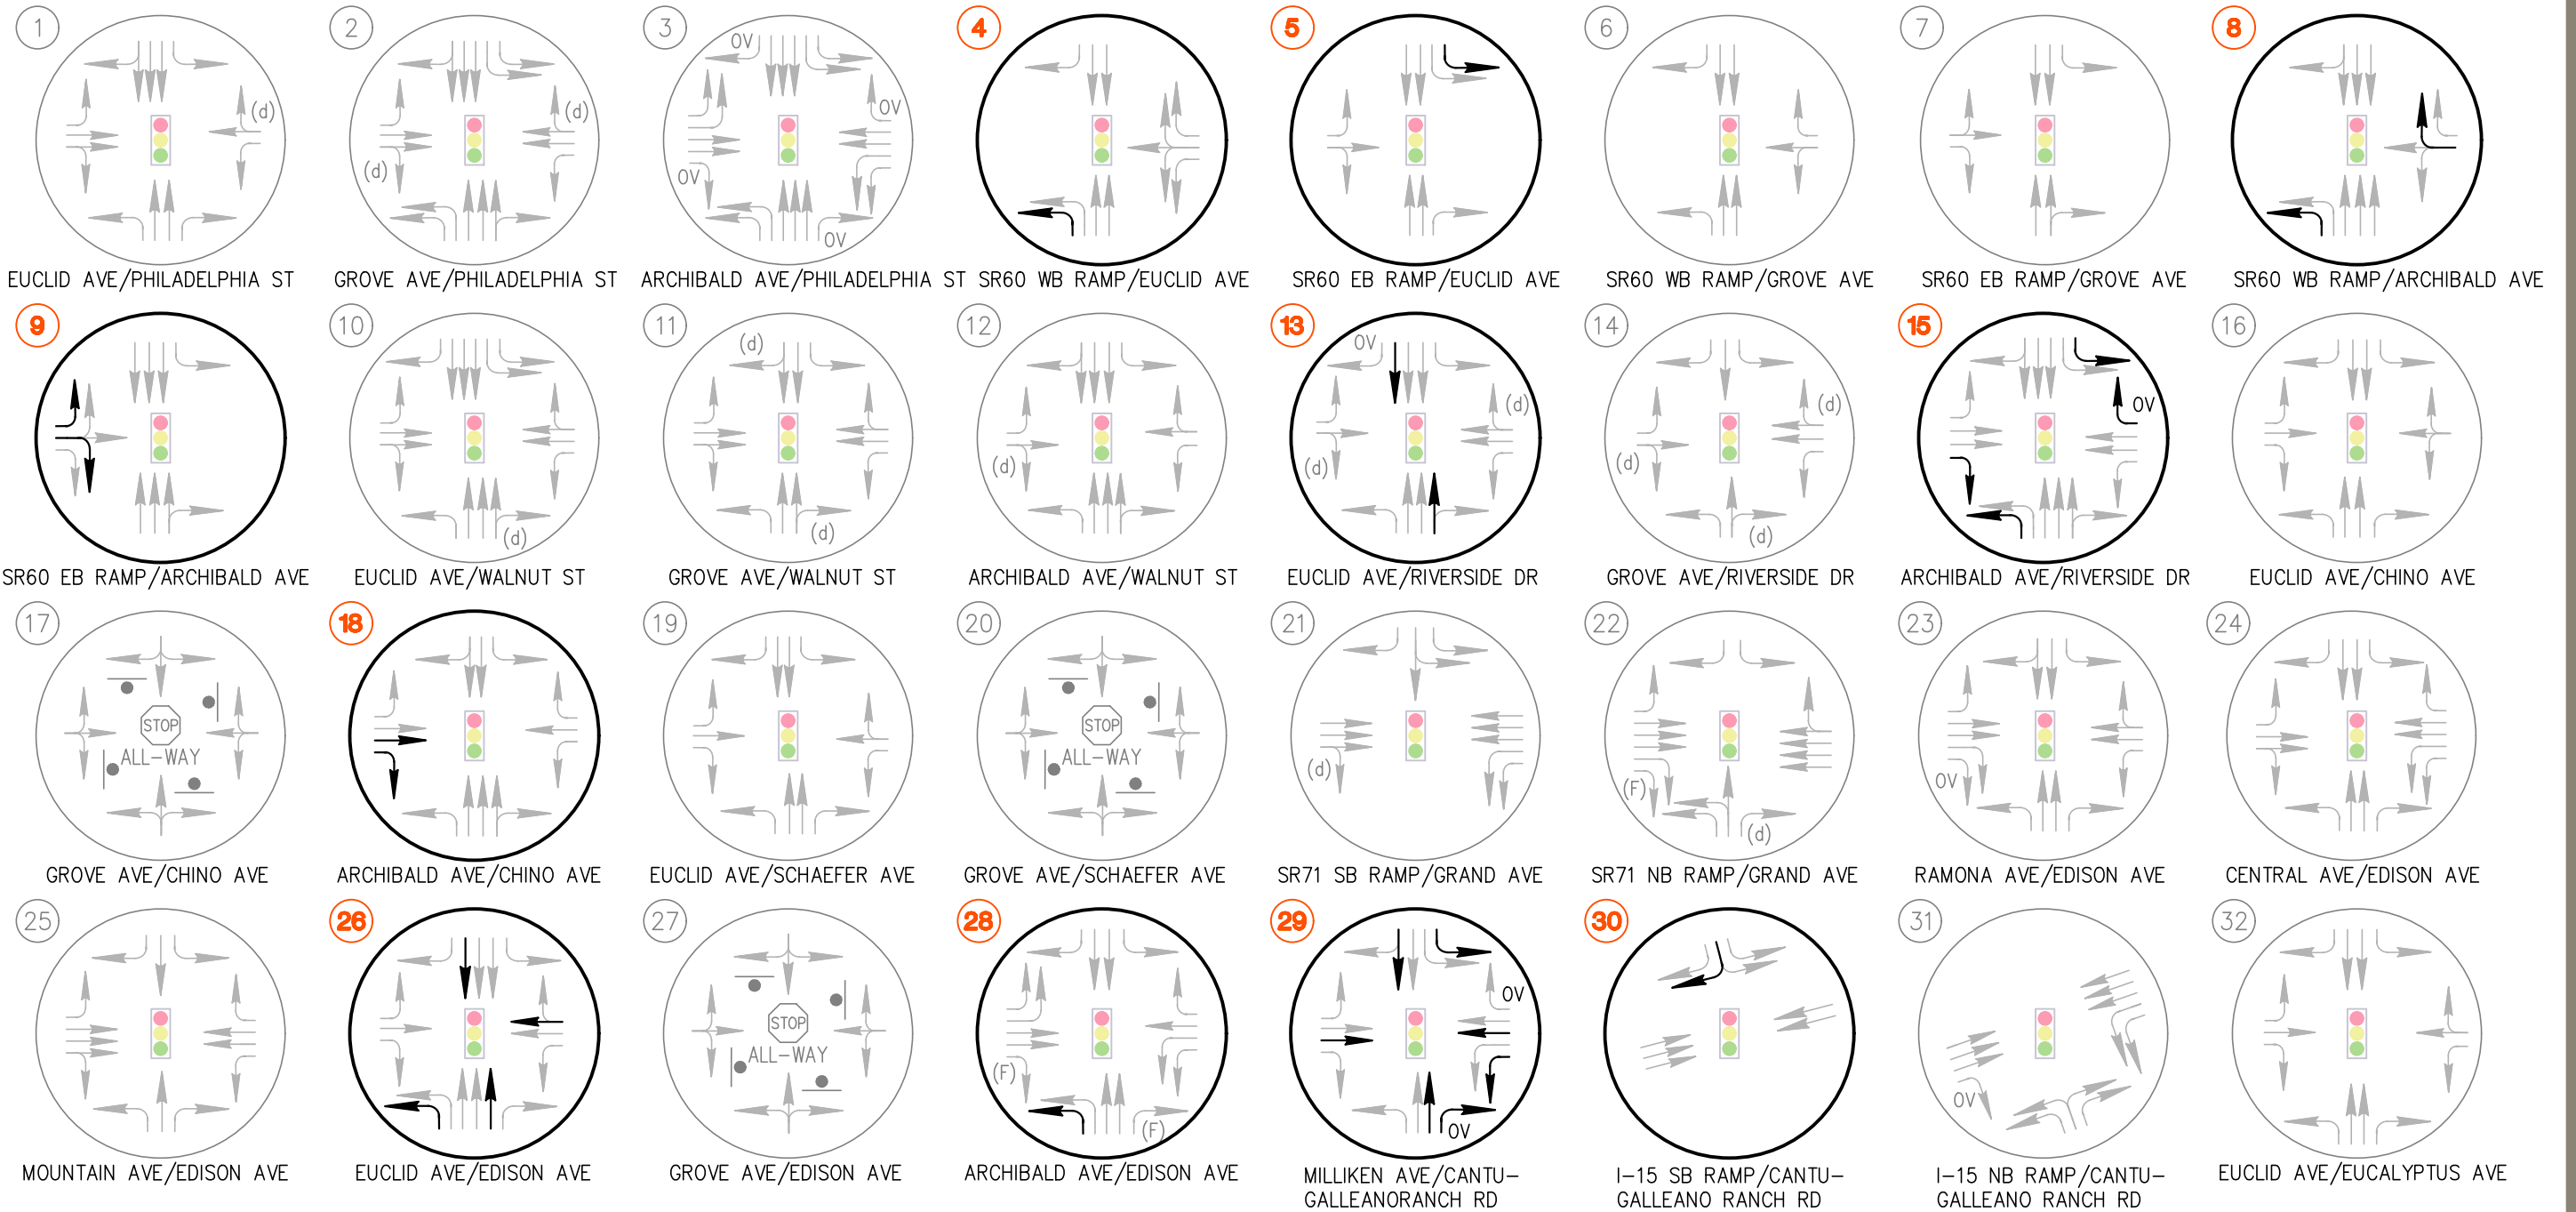

This scenario analyzes Horizon Year 2040 No Project traffic volume forecasts on the Horizon Year 2040 circulation network. The circulation network roadway is considered identical for Horizon Year 2040 no project and with project. For this scenario, the study area roadways and intersections are considered constructed to their Master Plan configuration and capacities. Where identified from other studies or existing conditions, some facilities are shown improved to a configuration greater than that indicated in the Master Plan (i.e. free right-turn lanes, additional turn lanes, etc.).

Table 2-6 shows that with the previous recommended improvements to address Opening Year 2023 cumulative project impacts and completion of planned Master Plan roadway and intersection improvements, all intersections are predicted to operate at acceptable LOS and no further mitigation improvements are indicated.

## 2.1.8. Freeway Mainline Analysis with Existing Peak Hour Volumes

### 2.1.8.1. State Route 60

Figure 2-10A provides a summary of mainline LOS analysis for the SR-60 Freeway with existing peak hour volumes using the 2010 Highway Capacity Manual method for basic freeway segments and merge/diverge points. This figure shows that typically SR-60 study segments are operating at LOS D or better with existing peak hour volumes. Existing level of service on the westbound SR-60 is LOS E at the Euclid Avenue off-ramp in both the am and pm peak hours. LOS calculations are included in the appendices.

### 2.1.8.2. Interstate 15

Figure 2-10B provides a summary of mainline LOS analysis for the I-15 Freeway with existing peak hour volumes using the 2010 Highway Capacity Manual method for basic freeway segments and merge/diverge points. This figure shows that typically I-15 study segments are operating at LOS D or better with existing peak hour volumes. LOS calculations are included in the appendices.

---

**3.1. PROPOSED SPECIFIC PLAN TRIP GENERATION**

Year 2023 site build-out trip generation of the proposed West Ontario Commerce Center development is shown on Table 3-1. Trip generation equations used to forecast traffic volumes produced by the project are identified by the Institute of Transportation Engineers (ITE), in *Trip Generation*, 9<sup>th</sup> Edition. Vehicle trips, including truck volumes, have been converted to passenger car equivalent (PCE) trips per the procedures of the *Fontana Truck Trip Generation Study*.

3.1.1. Project Build-out (Opening Year 2023)

At build-out, anticipated for completion in 2023, the proposed project is estimated to generate an average of 16,830 PCE vehicle trips ends per weekday. Forecast peak hour traffic generation is 1,174 inbound and 299 outbound PCE vehicle trips in the am peak hour and 382 inbound and 977 outbound trips in the pm peak hour.

3.1.2. Comparison to General Plan Site Trip Generation

Table 3-2 provides site trip generation as allowed under the current General Plan considering a maximum floor area ratio (FAR). As shown on Table 3-2, with the General Plan scenario, daily PCE trip generation increases to 24,564 trip ends per day, an increase of approximately 46% over the proposed specific plan land use.

3.1.3. Project Trip Distribution

Figures 3-1A through 3-1D show the Project trip distributions by analysis year, peak hours, and for trucks, as appropriate. The trip distributions shown on these figures were obtained from the San Bernardino Association of Governments (SANBAG) based on select zone traffic forecasts performed for this study using the San Bernardino (County)

March 2018

---

Traffic Analysis Model (SBTAM). SBTAM model output used to determine the Project trip distribution is included in the appendices.

### 3.2. PROJECT ONLY TRAFFIC VOLUME FORECASTS

Using the cumulative trip generation for each project phase and the appropriate project trip distribution, project only study area peak hour intersection turning movement and daily roadway volumes were developed for each analysis scenario.

#### 3.2.1 Project Only Traffic Volume Forecasts

Figure 3-2A provides Project only am and pm peak hour two-way roadway link volumes on study area roadway segments. Figures 3-2B through 3-2E show Project only weekday am and pm peak hour intersection turning movement volumes at study area intersections. Figure 3-3 shows Project only weekday 24-hour volumes on roadway segments and volume-to-capacity (v/c) ratios.

### 3.3. EXISTING YEAR (2017) WITH PROJECT TRAFFIC VOLUME FORECASTS

To develop forecasts for this scenario, project only traffic volumes were combined with existing (2017) volumes to develop Existing (2017) with project traffic volume forecasts.

Figure 3-4A provides Existing (2017) with Project am and pm peak hour two-way roadway link volumes on study area roadway segments. Figures 3-4B through 3-4E show Existing with Project weekday am and pm peak hour intersection turning movement volumes at study area intersections. Figure 3-5 shows Existing with Project weekday 24-hour volumes on roadway segments and volume-to-capacity (v/c) ratios.

### 3.4. OPENING YEAR 2023 WITH PROJECT TRAFFIC VOLUME FORECASTS

To develop forecasts for this scenario, project only traffic volumes were combined with existing and cumulative project volumes associated with projects to be developed in or prior to 2023, to develop total Opening Year 2023 with project traffic volume forecasts.

#### 3.4.1. Opening Year 2023 with Project Traffic Volumes

Figure 3-6A provides Opening Year 2023 with Project am and pm peak hour two-way roadway link volumes on study area roadway segments. Figures 3-6B through 3-6E show Opening Year 2023 with Project weekday am and pm peak hour intersection turning movement volumes at study area intersections. Figure 3-7 shows Opening Year 2023 with Project weekday 24-hour volumes on roadway segments and volume-to-capacity (v/c) ratios.

### 3.5. HORIZON YEAR 2040 WITH PROJECT TRAFFIC VOLUME FORECASTS

Horizon Year 2040 traffic forecasts were derived from regional SBTAM model output of future daily volumes and were post-processed/refined as appropriate to develop am/pm peak hour 2040 turning movement volumes. This process typically involved

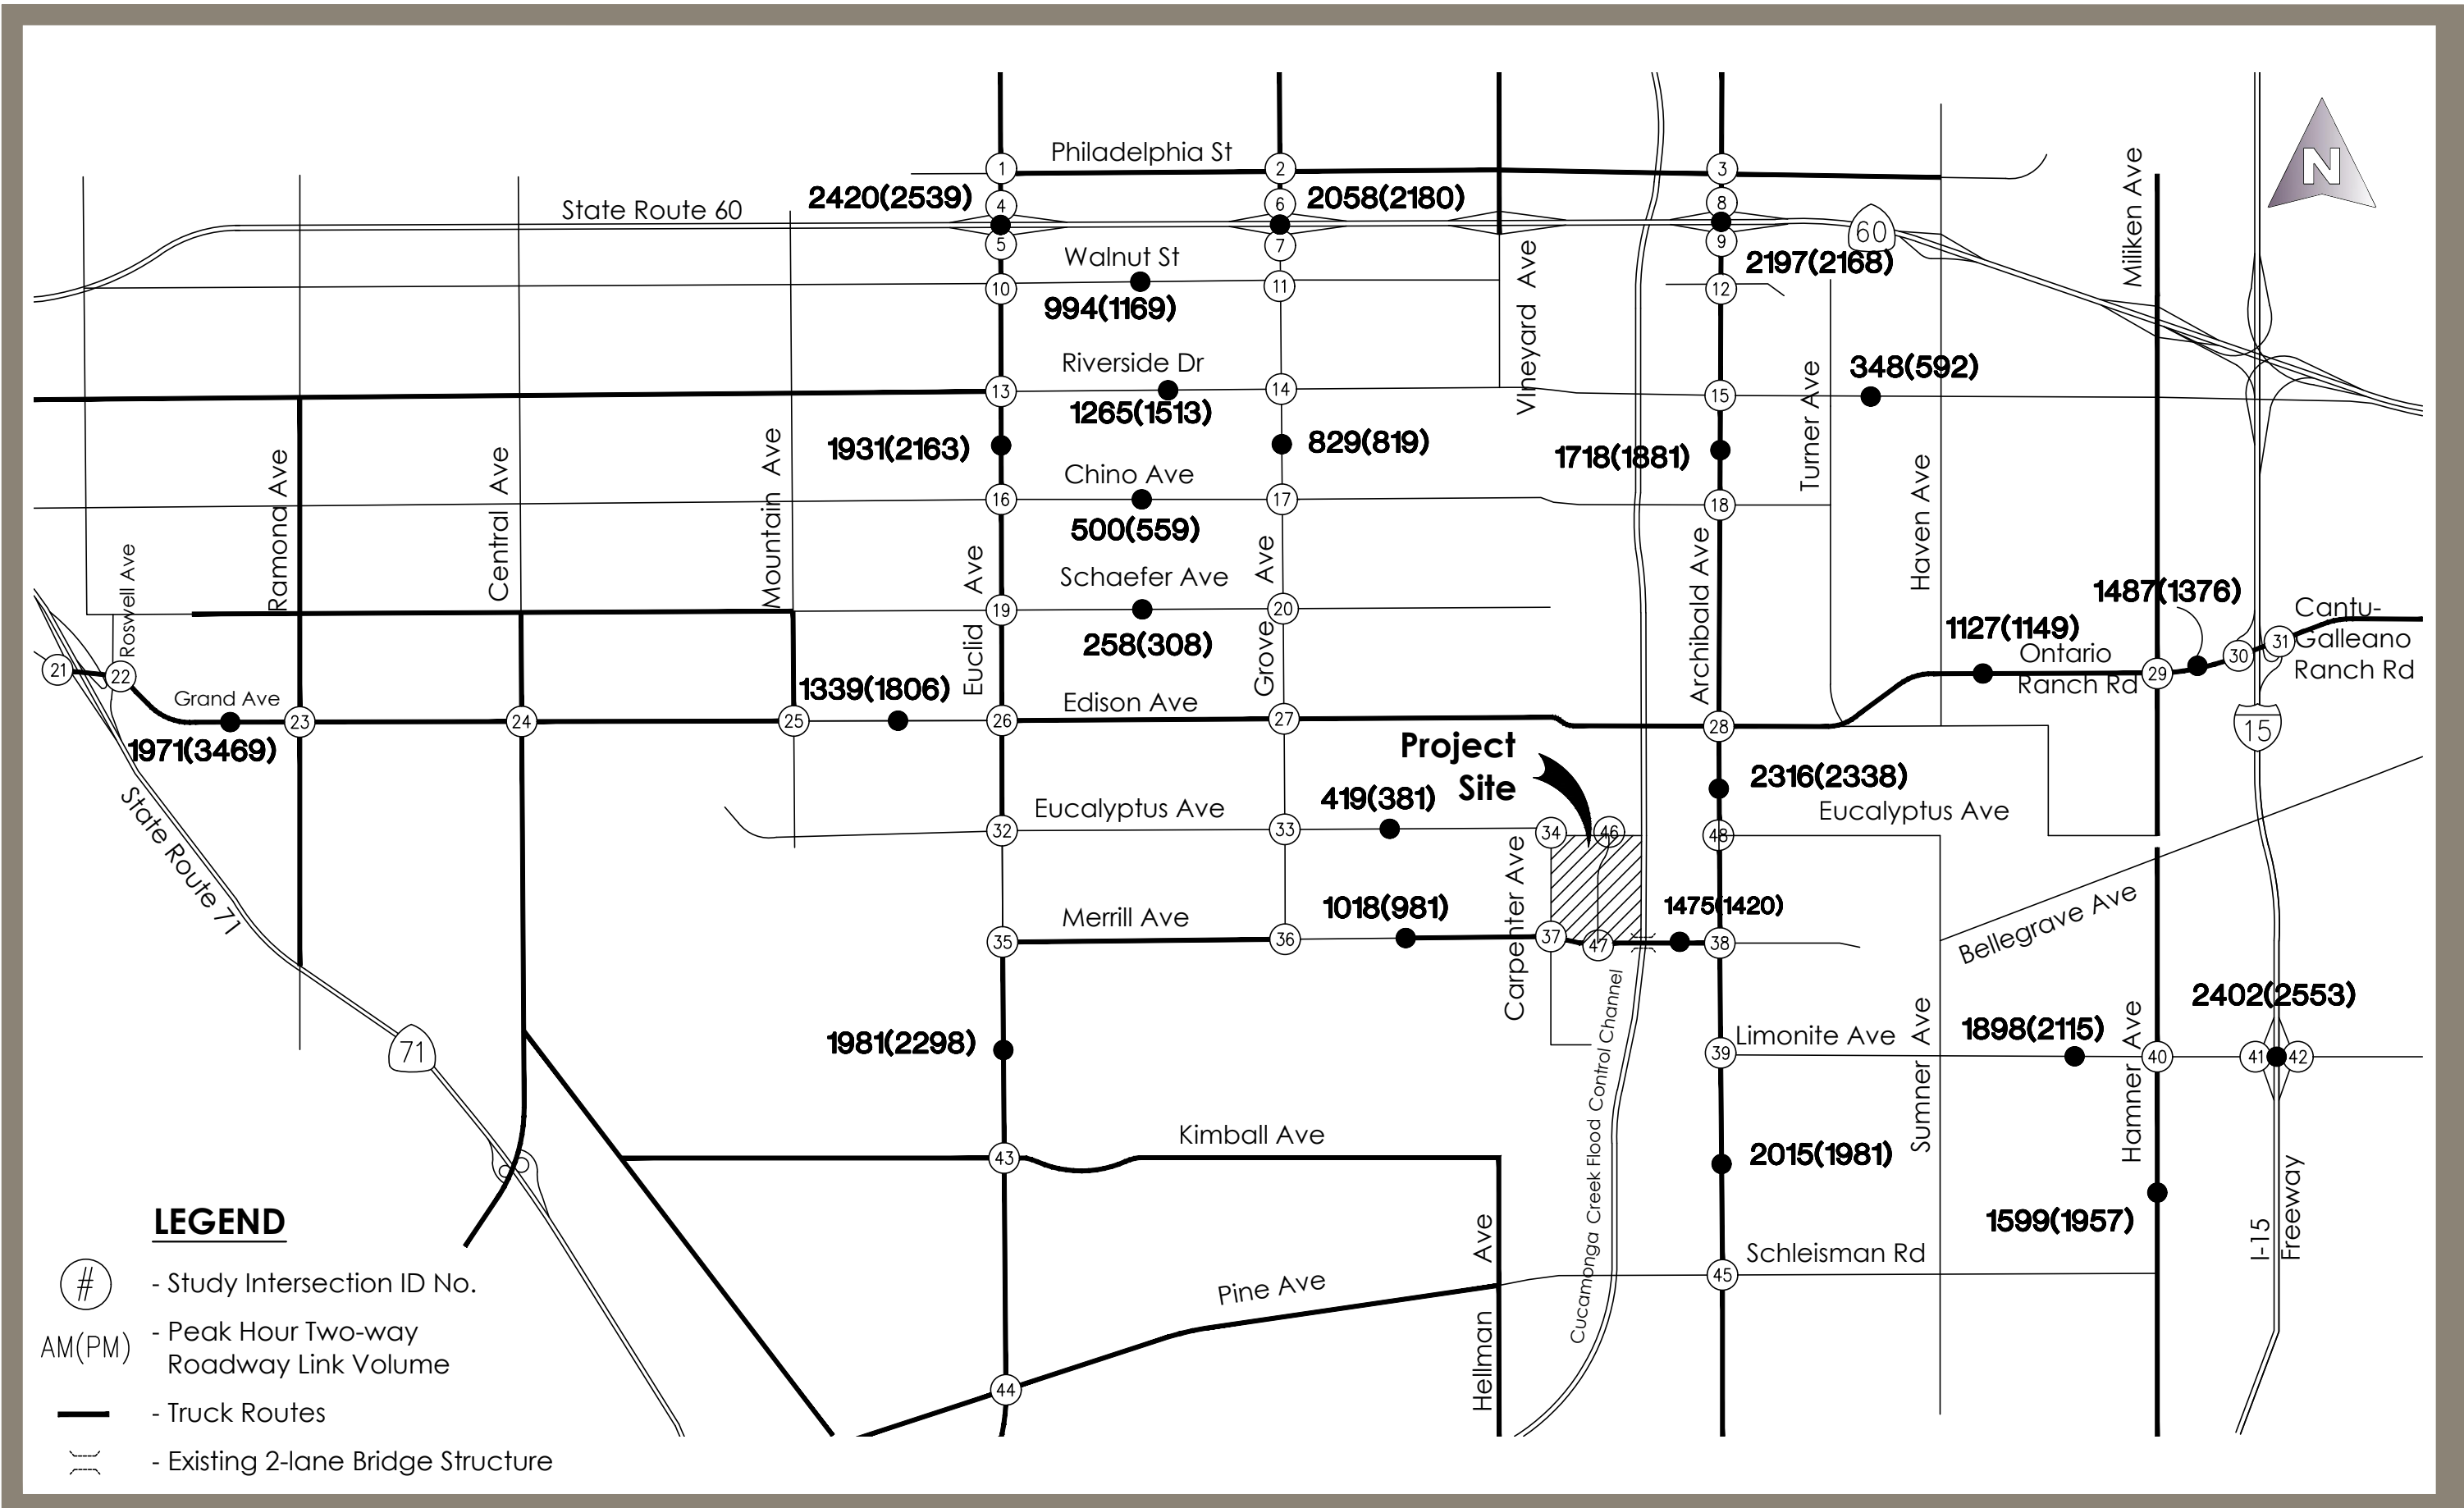

March 2018

---

using the existing counts (March 2017) as initial values and increasing the volumes to match the growth forecast by comparison with SBTAM daily 2040 volumes. Refinement also included techniques including calibration, balancing, conversion of flow, integration with the local network analysis model (PTV Vistro), and reasonableness checking. Reasonableness checking including comparison of forecast Horizon Year 2040 daily volumes identified in this study with those in the recently prepared traffic impact analysis for the Colony Commerce Center East Specific Plan, November 2, 2017. The Horizon Year 2040 forecasts typically vary by 5-6% or less and no more than 10%.

### 3.5.1. Horizon Year 2040 with Project Traffic Volumes

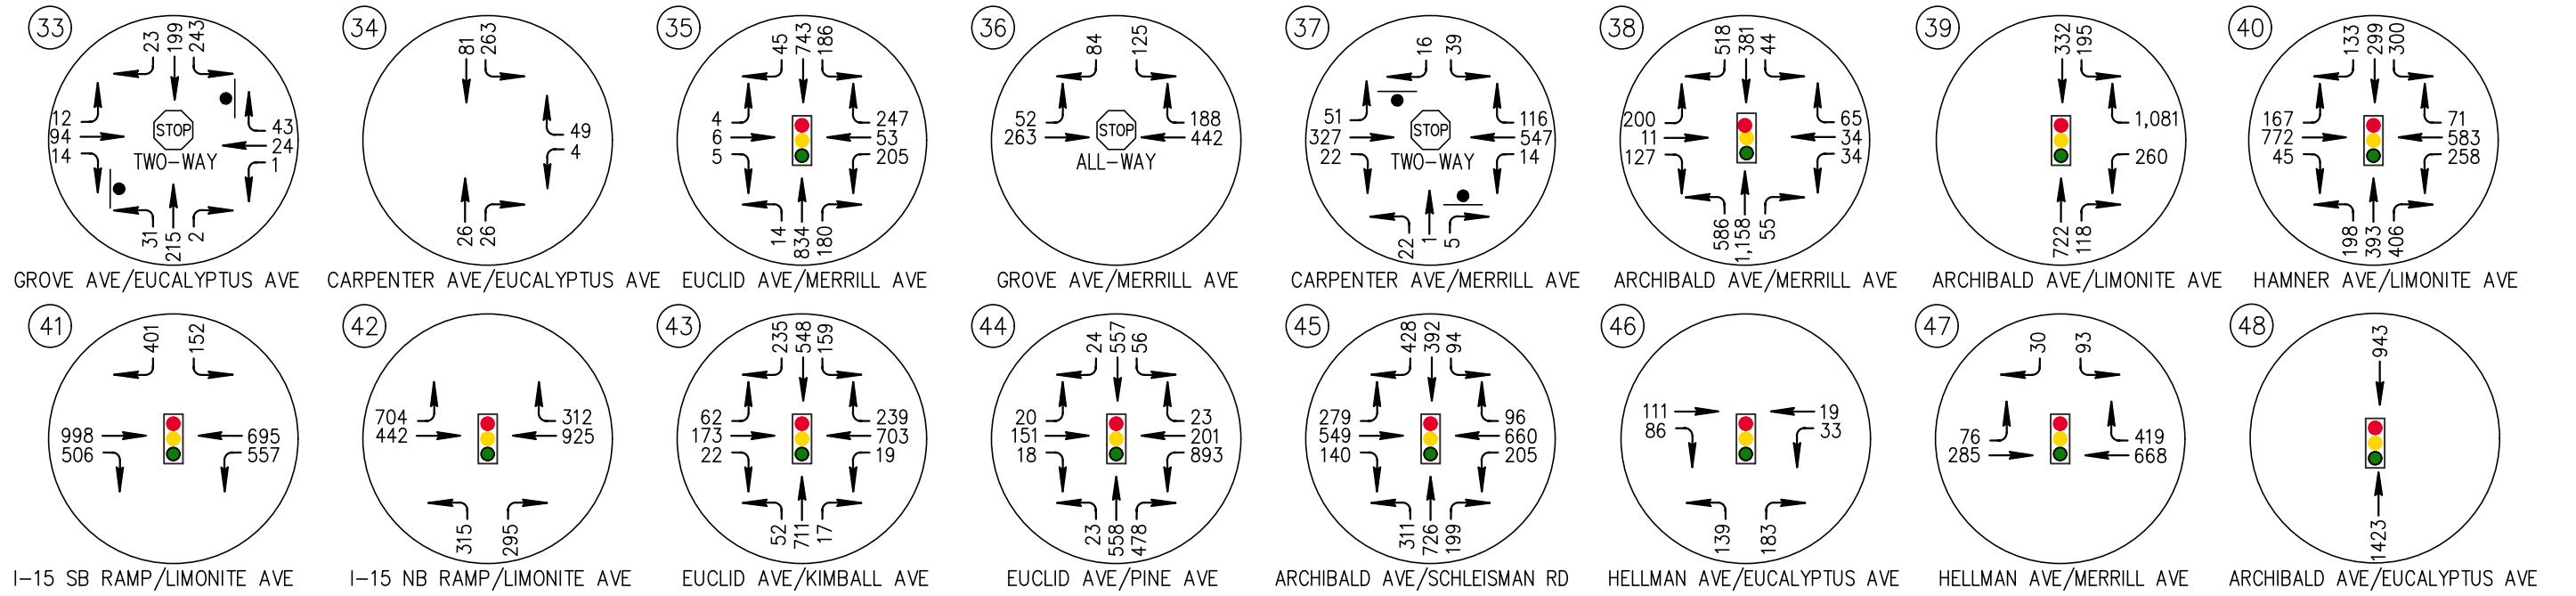

Forecast Horizon Year 2040 with Project am and pm peak hour two-way roadway link volumes are shown on Figure 3-8A. Figures 3-8B through 3-8E show Horizon Year 2040 with Project weekday am and pm peak hour intersection turning movement volumes at study area intersections. Figure 3-9 shows Horizon Year 2040 with Project weekday 24-hour volumes on roadway segments and volume-to-capacity (v/c) ratios.

**SECTION 4.0 ROADWAY TRAFFIC ANALYSIS**

---

**4.1. EXISTING (2017), OPENING YEAR 2023, AND HORIZON YEAR 2040 WITH PROJECT TRAFFIC CONDITIONS**

Existing (2017), Opening Year 2023, and Horizon Year 2040 with Project traffic volumes as shown on Figures 3-4A through 3-9 were analyzed considering the respective roadway networks for each scenario to confirm provided LOS. Roadway segment LOS was determined based on volume-to-capacity (v/c) analysis using City General Plan capacities for each roadway type. Intersection LOS was determined using the 2010 Highway Capacity Manual (HCM) signalized/unsignalized operational methods. The target level of service to be maintained throughout the project study area has been established by the City as Level of Service D for roadways and Level of Service E for intersections within the City of Ontario.

**4.1.1. Existing (2017) with Project Traffic Conditions**

For this scenario, Existing with Project traffic volume forecasts shown on Figures 3-4A through 3-5 have been analyzed on the existing (2017) circulation network (Figures 2-1A through 2-1C). No off-site intersection or roadway improvements to the 2017 network have been considered. Project frontage and access improvements are included.

Table 4-1 shows intersection LOS analysis results for forecast Existing (2017) with Project conditions. Table 4-2 is an excerpt from Table 4-1 showing the one (1) intersection that is predicted to operate at LOS F in at least one peak hour:

A recommended intersection mitigation measure that will return this intersection to acceptable LOS is identified on Table 4-3. An analysis of the West Ontario Commerce Center Project fair share contribution to the estimated rough cost of this improvement is provided on Table 1-1 in the Executive Summary section of this study. With implementation of the identified project mitigation measure signalization, the LOS at

March 2018

---

Grove Avenue/Edison Avenue intersection will provide acceptable LOS as shown on Table 4-3. This offsite mitigation improvement is shown on Figures 4-1A through 4-1C together with the project access improvements at adjacent intersections. Table 1-2 provided in the Executive Summary section identifies the West Ontario Commerce Center Project fair share percentage towards providing signalization at the Grove Avenue/Euclid Avenue intersection.

Figure 3-5 shows that study area roadway segments will typically have volume-to-capacity ratios of 0.90 or below indicating LOS D or better operation based on Existing (2017) with Project 24-hour volumes.

#### 4.1.2. Opening Year 2023 with Project Traffic Conditions

For this scenario, Opening Year 2023 with Project traffic volume forecasts shown on figures 3-6A through 3-7 have been analyzed on the Opening Year (2023) circulation network (Figures 2-9A through 2-9C). This network reflects the intersection improvements listed on Table 2-4 associated with cumulative development projects identified for inclusion in this study. No other roadway or intersection improvements are considered for the 2023 network. Project frontage and access improvements are included.

Table 4-4 shows cumulative project impact for forecast Opening Year 2023 with Project conditions. This table shows that with cumulative project impacts including the West Ontario Commerce Center (WOCC) Project, fourteen (14) study area intersections are predicted to operate at unacceptable LOS. Table 4-4 also shows that the WOCC Project has a significant cumulative impact at each intersection and these intersections are summarized in Table 4-5.

Table 4-6 identifies recommended mitigation improvements for each of the intersections predicted to have deficient LOS under forecast Opening Year 2023 with Project peak hour conditions. The recommended mitigation improvements listed in Table 4-6 are shown on Figures 4-2A through 4-2C. The Project fair share contribution to

March 2018

---

the estimated rough cost of each improvement is provided on Table 1-1 in the Executive Summary section of this study.

The Project roadway infrastructure improvements will include all frontage improvements as included in the Specific Plan including a fair share contribution (60.21%) toward construction of the ultimate Eucalyptus Avenue bridge structure over the Cucamonga Flood Control Channel which was included in analysis of this scenario. The fair share contribution percentage toward the construction of Eucalyptus Avenue bridge structure is calculated by dividing the sum of estimated AM and PM peak hour bridge traffic generated by the Project by the total sum of AM and PM peak hour bridge traffic generated by all of the cumulative project traffic including the West Ontario Commerce Center project. It is assumed that completion of the ultimate bridge structure will be coordinated with the adjacent Parkside and Subarea 29 developments to complete ultimate improvements to Eucalyptus Avenue between the channel and the Archibald Avenue intersection.

#### 4.1.3. Horizon Year 2040 with Project

This scenario analyzes Horizon Year 2040 with Project traffic volume forecasts shown on Figures 3-8A through 3-9 on the Horizon Year 2040 circulation network. The Horizon Year 2040 circulation network roadway and intersection configurations are shown on Figures 4-3A through 4-3C. Table 4-7 shows that similar to Horizon Year 2040 No Project conditions, no deficient intersection LOS has been identified and no further mitigation improvements are indicated.

## **SECTION 5.0** **FREEWAY MAINLINE ANALYSIS**

---

Existing and Opening Year 2023 with Project am/pm peak hour freeway mainline volumes and level of service for Year 2023, and Horizon Year 2040 scenarios are provided on Figures 5-1A, 5-2A, and 5-3A respectively, for State Route 60, and on Figures 5-1B, 5-1B, and 5-1B respectively, for Interstate 15. LOS calculations are included in the appendices.

### 5.1. SR-60 FREEWAY MAINLINE ANALYSIS – OPENING YEAR 2023 AND HORIZON YEAR 2040 WITH PROJECT CONDITIONS

Table 5-1 provides a summary of mainline LOS analysis for the SR-60 Freeway with Opening Year 2023 with Project and Horizon Year 2040 peak hour volumes. Table 5-1 shows that typically SR-60 study segments will operate at LOS E or F with forecast cumulative Project Year and Horizon Year 2040 volumes. At this time, there is no fee program or mechanism by which deficiencies associated with future development may be addressed. Freeway mainline LOS calculations are included in the appendices.

### 5.2. I-15 FREEWAY MAINLINE ANALYSIS – OPENING YEAR 2023 AND HORIZON YEAR 2040 WITH PROJECT CONDITIONS

Table 5-2 provides a summary of mainline LOS analysis for the I-15 Freeway with Opening Year 2023 with Project and Horizon Year 2040 peak hour volumes. Table 5-2 shows that typically I-15 study segments will operate at LOS E or F south of the Cantu-Galleano Ranch Road interchange with forecast cumulative Project Year and Horizon Year 2040 volumes. There are currently long range plans to add capacity to the I-15 Freeway from SR-74 in Lake Elsinore to the SR-60 in Ontario. Freeway mainline LOS calculations are included in the appendices.

**SECTION 6.0 FINDINGS AND RECOMMENDATIONS**

---

6.1. ROADWAY AND INTERSECTION INFRASTRUCTURE IMPLEMENTATION PLAN

This analysis has confirmed that LOS D or better will typically be maintained throughout the project study area roadway segments at Opening Year 2023 and at 2040 Horizon Year (build-out) based on the infrastructure improvements identified in the West Ontario Commerce Center Specific Plan. Roadway improvements will be implemented to construct half-sections of ultimate roadway configurations along the Project frontage and full-width roadway improvements will be constructed for Hellman Avenue. Figures 6-1A and 6-1B provide the City roadway classifications and Specific Plan cross sections for Merrill Avenue, Hellman Avenue, Carpenter Avenue and Eucalyptus Avenue.

Implementation of planned improvements to Merrill and Eucalyptus Avenues will require widening and construction, respectively, of bridge structures over the Cucamonga Flood Control Channel. The widening of the Merrill Avenue bridge should correspond and be coordinated with improvements to Merrill Avenue to a four-lane collector roadway from the channel to Archibald Avenue.

The Specific Plan identifies that the intersections of Merrill Avenue/Hellman Avenue and Eucalyptus Avenue/Hellman Avenue are to be signalized with project development and both intersections are therefore considered in this analysis as signalized by 2023.

6.1.1. Off-site Intersection and Roadway Analysis and Mitigation Recommendations

This study confirms that roadway segments included in this analysis will typically meet or exceed LOS E performance criteria for existing with project, cumulative project, and Horizon Year 2040 conditions. Mitigation improvements at deficient study area intersections have been identified where the Project has a significant Existing with Project or cumulative Opening Year 2023 impact. These intersection improvements are summarized together with agency jurisdiction, funding program information, estimated

March 2018

---

rough cost, and Project fair share contribution on Table 1-1 in the Executive Summary section of this report. Analysis of Horizon Year 2040 conditions indicates that following contribution to mitigation of Opening Year 2023 cumulative project impacts, there are no further study area deficiencies associated with Horizon Year 2040 no Project or with Project conditions. Below is a summary of mitigations that shall be done by the West Ontario Commerce Center Project:

1. Construct Traffic Signal Improvements at Grove and Edison
2. Contribute \$73,465 in fair share mitigation to the City of Ontario (non-DIF)
3. Contribute \$98,982 to the City of Chino
4. Contribute \$256,557 to the City of Eastvale
5. Contribute \$95,818 to Caltrans

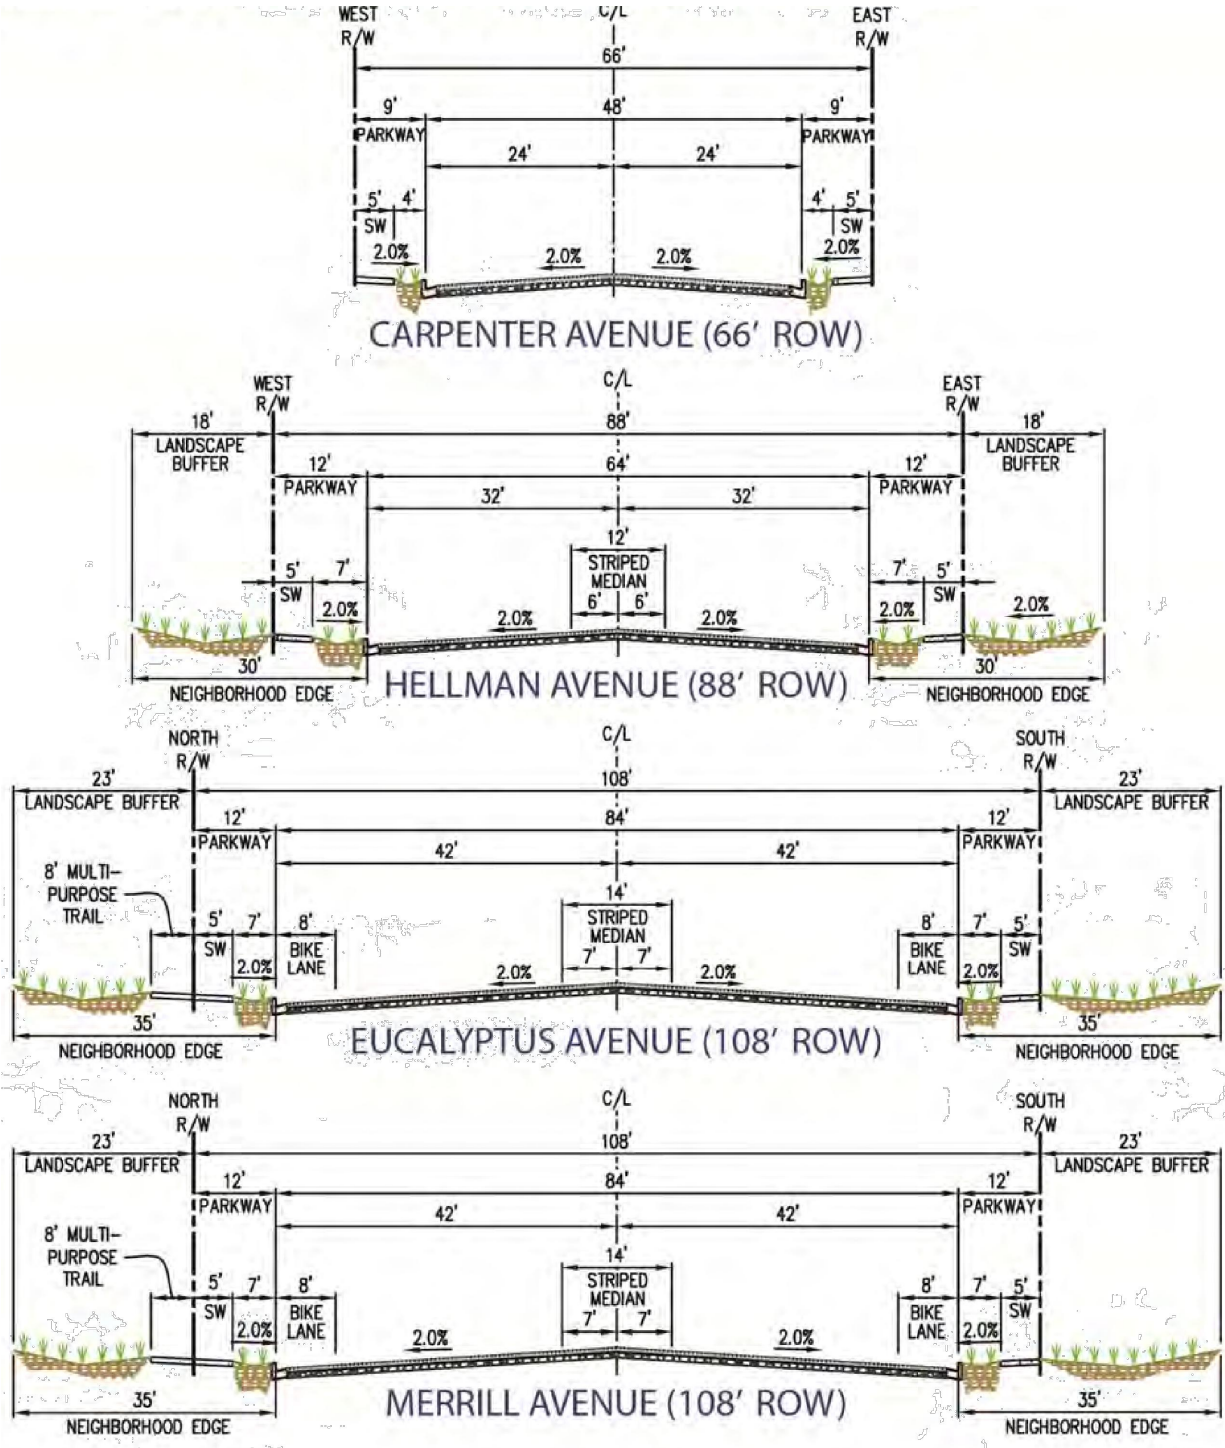

The total Project contribution to the City of Ontario DIF is \$1,099,901 and the Project's total fair share cost is estimated at \$1,624,723

The Project fair share contribution to the respective agencies were determined by summing up the improvement costs of the intersections that are identified to have significant impact. The improvements that would be funded by the City's DIF program are not included in the Project's estimated total project fair share contribution.

#### 6.1.2. SR-60 and I-15 Freeway Mainline Analysis

This study analyzed existing freeway traffic volumes and future forecasts of Project and cumulative project volumes and identified that for existing peak hour conditions the SR-60 and I-15 Freeways are typically operating at LOS D or better. With future cumulative project conditions, however, the SR-60 and I-15 Freeways are anticipated to typically operate at LOS F during peak hours. At this time, there is no fee program or mechanism by which deficiencies associated with future development may be addressed. There are currently long-range plans to add capacity to the I-15 Freeway from SR-74 in Lake Elsinore to the SR-60 in Ontario.

File: Impact of ITE Trip Generation Manual Update to the TIA

Date: March 9, 2018

**Reference: West Ontario Commerce Center Specific Plan Traffic Impact Analysis**

The West Ontario Commerce Center Specific Plan Traffic Impact Analysis references the ITE Trip Generation Manual 9<sup>th</sup> Edition to estimate the project trip generation per the direction of the City of Ontario as the 9<sup>th</sup> Edition Manual was the latest available reference at the commencement of the analysis. However, 10<sup>th</sup> Edition update was introduced in the Fall of 2017 while the project began in early 2016.

Below is the comparison of ITE Trip Generation Manual 9<sup>th</sup> edition and 10<sup>th</sup> Edition trip generation rates for land use codes 150 Warehousing and 770 Business Park,

**Trip Rates**

**ITE Trip Generation Manual, 9<sup>th</sup> Edition**

Land Use (Code No.)	Weekday 24-hr Avg. Rate	AM Peak Hour		PM Peak Hour	
		In	Out	In	Out
Warehousing (150)	3.56	0.24	0.06	0.08	0.24
Business Park (770)	12.44	1.19	0.21	0.33	0.93

**ITE Trip Generation Manual, 10<sup>th</sup> Edition**

Land Use (Code No.)	Weekday 24-hr Avg. Rate	AM Peak Hour		PM Peak Hour	
		In	Out	In	Out
Warehousing (150)	1.74	0.13	0.04	0.05	0.14
Business Park (770)	12.44	0.24	0.16	0.19	0.23

As shown on tables above, identified trip rates for Warehousing land use in the 9<sup>th</sup> Edition of the ITE Trip Generation Manual are consistently higher than the 10<sup>th</sup> edition and especially for the weekday 24-hr average rate, the rate is significantly higher (almost 200%). Business Park land use identifies the same rate for weekday 24-hr average rate in each edition, while the peak hour rates are significantly higher in the 9<sup>th</sup> edition.

ITE Trip Generation Manuals also provide fitted curve equations based on the average rates above. The trip generation prepared for the West Ontario Commerce Center (WOCC) Traffic Impact Analysis used fitted curve equations from the 9<sup>th</sup> edition. Below is a summary of the WOCC trip generation based on equations provided in the Trip Generation Manuals 9<sup>th</sup> and 10<sup>th</sup> editions for each land use.

Reference: West Ontario Commerce Center Specific Plan Traffic Impact Analysis

### Project Trip Generation

**ITE Trip Generation Manual, 9<sup>th</sup> Edition**

Land Use	Quantity	Weekday ADT	AM Peak Hour		PM Peak Hour	
			In	Out	In	Out
1a. Warehouse East	1,253,889	3,674	235	63	67	199
1b. Warehouse West	1,276,116	4,124	254	67	72	217
2. Business Park	555,505	6,615	638	113	180	511
Total	-	14,413	1,127	242	319	927

**ITE Trip Generation Manual, 10<sup>th</sup> Edition**

Land Use	Quantity	Weekday ADT	AM Peak Hour		PM Peak Hour	
			In	Out	In	Out
1a. Warehouse East	1,253,889	2,027	135	40	48	130
1b. Warehouse West	1,276,116	2,062	137	41	49	132
2. Business Park	555,505	6,615	135	87	107	126
Total	-	10,704	407	168	204	388

Trips in the tables above include passenger vehicles and trucks and have not been converted to passenger car equivalents (PCE).

### **Comparison of 9<sup>th</sup> Edition vs. 10<sup>th</sup> Edition Project Trip Generation**

ITE Trip Generation Manual Editions	Weekday ADT	AM Peak Hour		PM Peak Hour	
		In	Out	In	Out
9 <sup>th</sup> Edition	14,413	1127	242	319	927
10 <sup>th</sup> Edition	10,704	407	168	204	388
<b>Change</b>	<b>(3,709)</b>	<b>(720)</b>	<b>(74)</b>	<b>(115)</b>	<b>(539)</b>
<b>Percent</b>	<b>(25.7%)</b>	<b>(63.9%)</b>	<b>(30.6%)</b>	<b>(36.1%)</b>	<b>(58.1%)</b>

Comparison of project trip volumes based on the 10<sup>th</sup> edition of the ITE Trip Generation Manual are significantly lower than those forecasted with use of the 9<sup>th</sup> edition. Therefore, the project study trip generation forecast is considered conservative.
